The PyMca X-ray Fluorescence Toolkit

Friday, 16 September 2011 10:15 (45 minutes)

PyMca is a set of open source software tools for XRF analysis that is becoming a standard for users of most synchrotrons and for many X-ray tube based laboratories. This talk will present the algorithms used, the built-in features and the current developments. Following the “open policy” of the toolkit, not only the strengths, but also the limitations of PyMca in the context of the workshop will be underlined.
