# Beam Loss Monitoring at SwissFEL

Accelerator Seminar

19 February 2018

## Purpose of the machine protection system (MPS):

- Protection of the machine (Undulators, electronics, etc)
- Facilitates operation of the machine

## Alarm Levels

### Level 0 alarm (screen insertion):

- Repetition rate limited to 10Hz

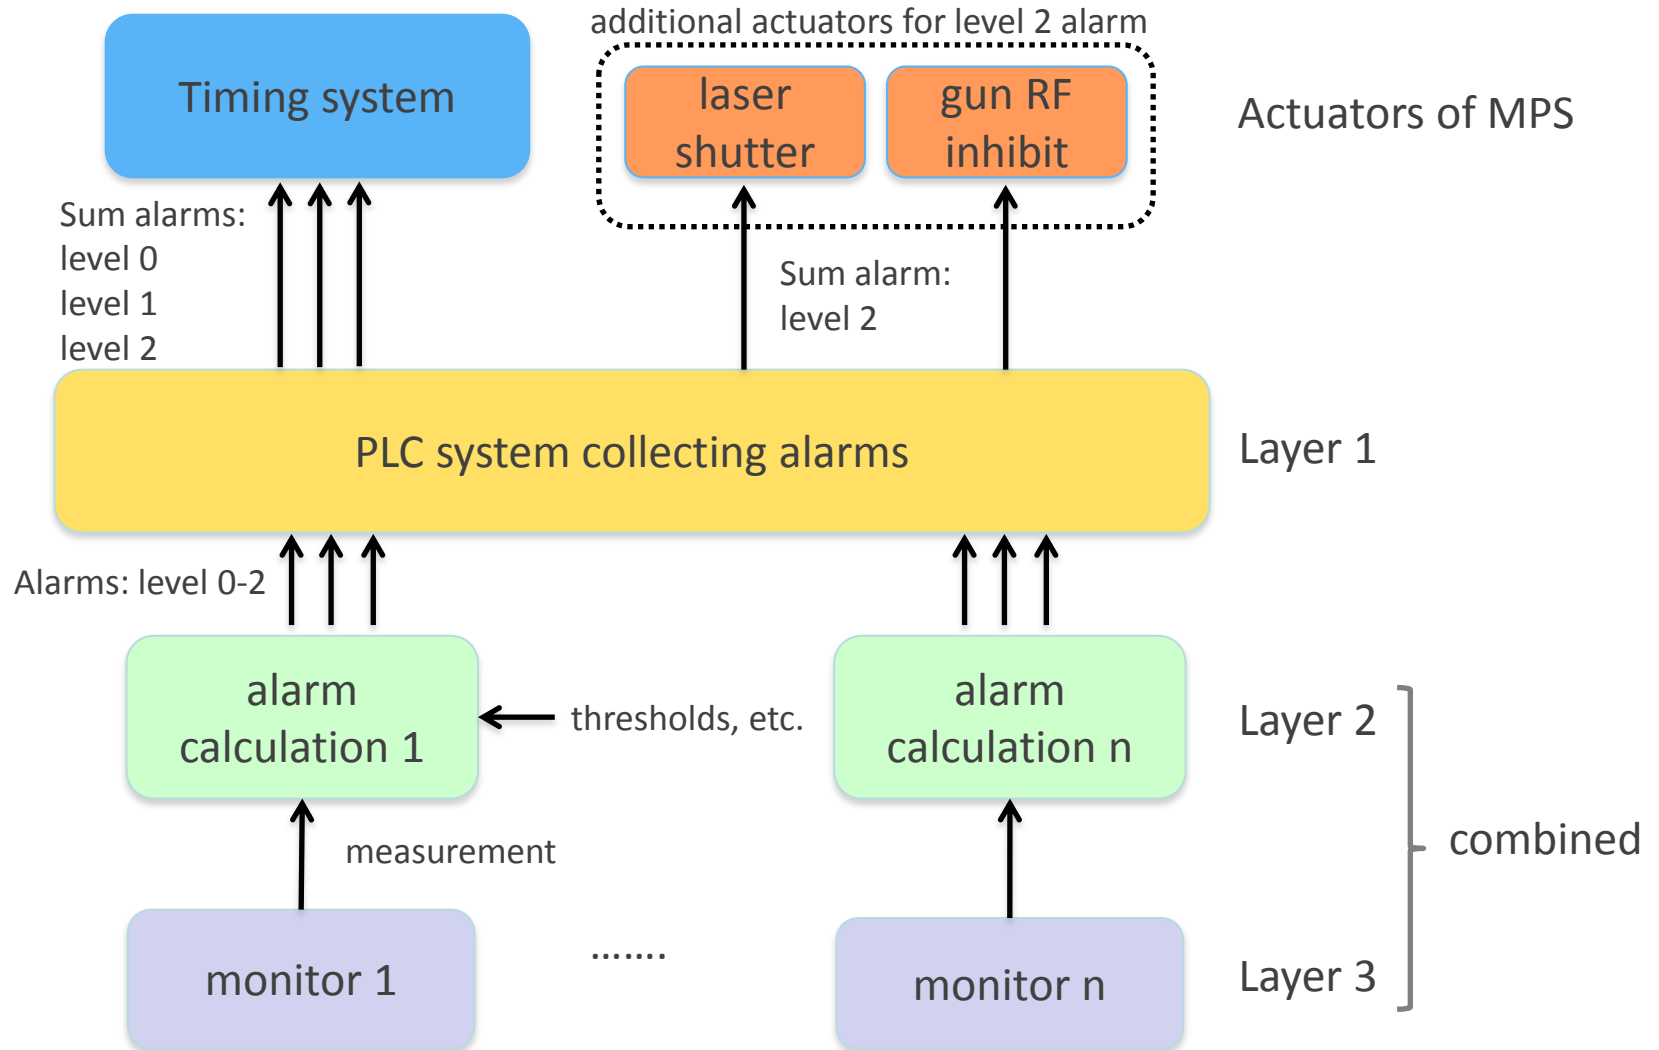

### Level 1 alarm (minor):

- Gun RF timing shifted by 10 $\mu$ s
  - No beam generated
  - Gun dark current not accelerated

### Level 2 alarm (major):

- Machine will be stopped
  - Laser shutter closed
  - Gun RF turned off

# Principle of the MPS

# Monitors used in the MPS

	Device	Alarms on	
Hardware protection	Beam loss monitors	Beam loss exceeding set alarm threshold	● ←
	Beam position monitors	x, y, Q	●
	Charge monitors (ICT)	Q	●
	Screen monitors	Inserted/undefined state	●
	RF stations	Interlock	●
	Magnet power supply controllers	Magnet error	●
Software protection	Vacuum system	Vacuum error	●
	Machine mode monitor	Undefined machine mode	●
	Dose monitors	Exceeded dose per hour/day	● ←
	Differential charge monitoring		●
	Charge monitors	Total Q in 1 hour	●

# Dose monitoring

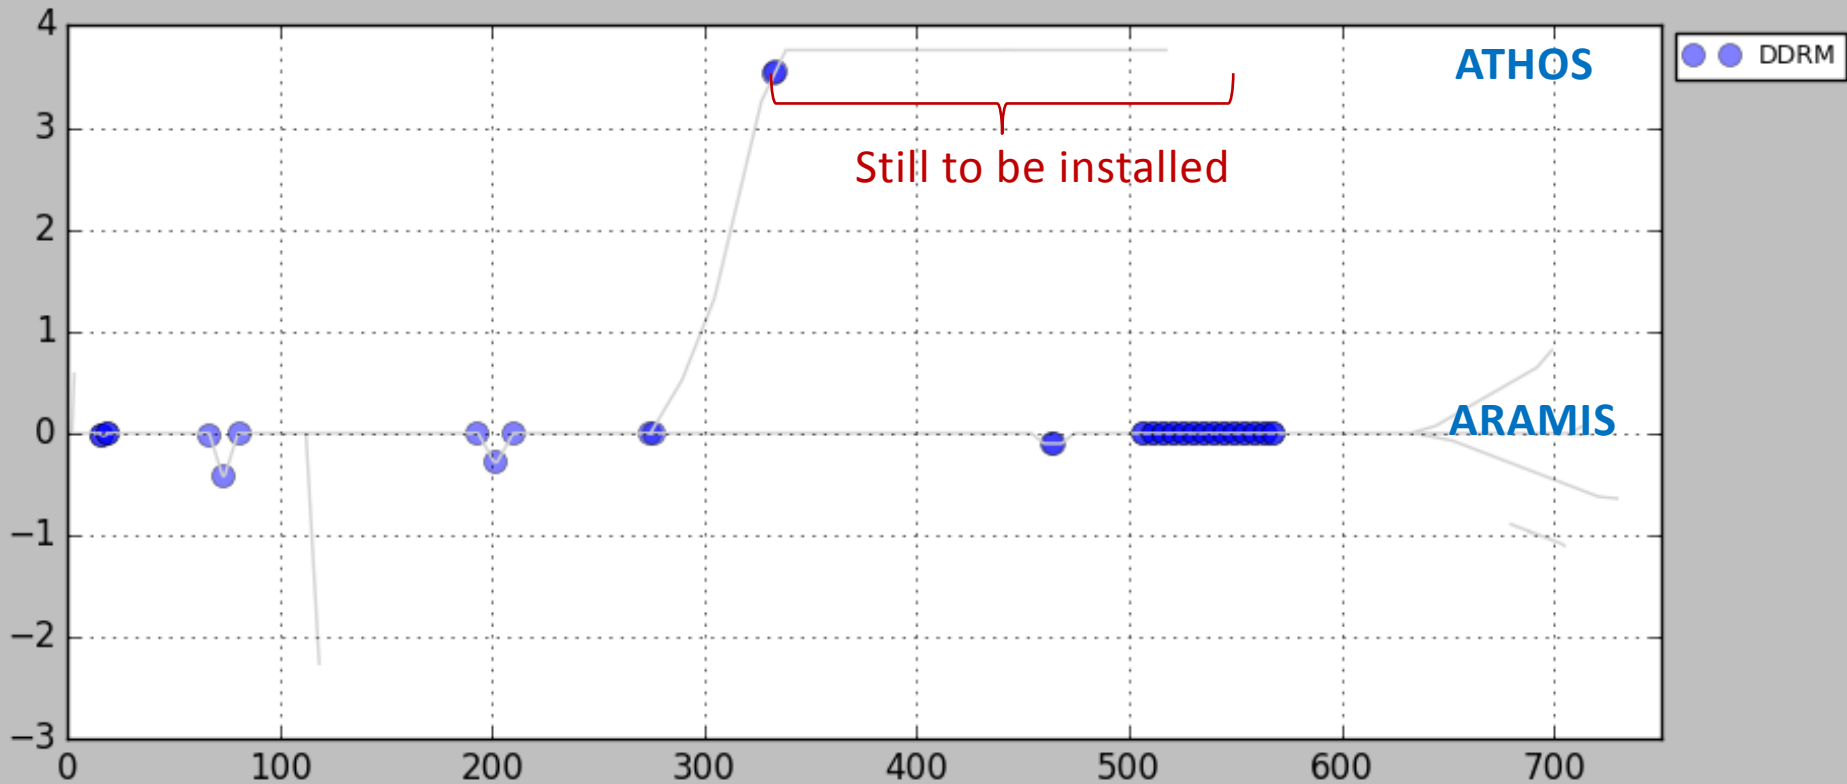

- To track accumulated dose
- Tested at the SITF around Undulator
- Distance of RadFET to the beam pipe flange is  $\sim 1\text{mm}$
- Operated in 25V bias mode \* for Undulators
- Minimum integration time 20 seconds
- Undulator protection:  
Closes MPS shutter if permitted dose rate (eg, 0.05Gy/20s) or daily dose limit is exceeded

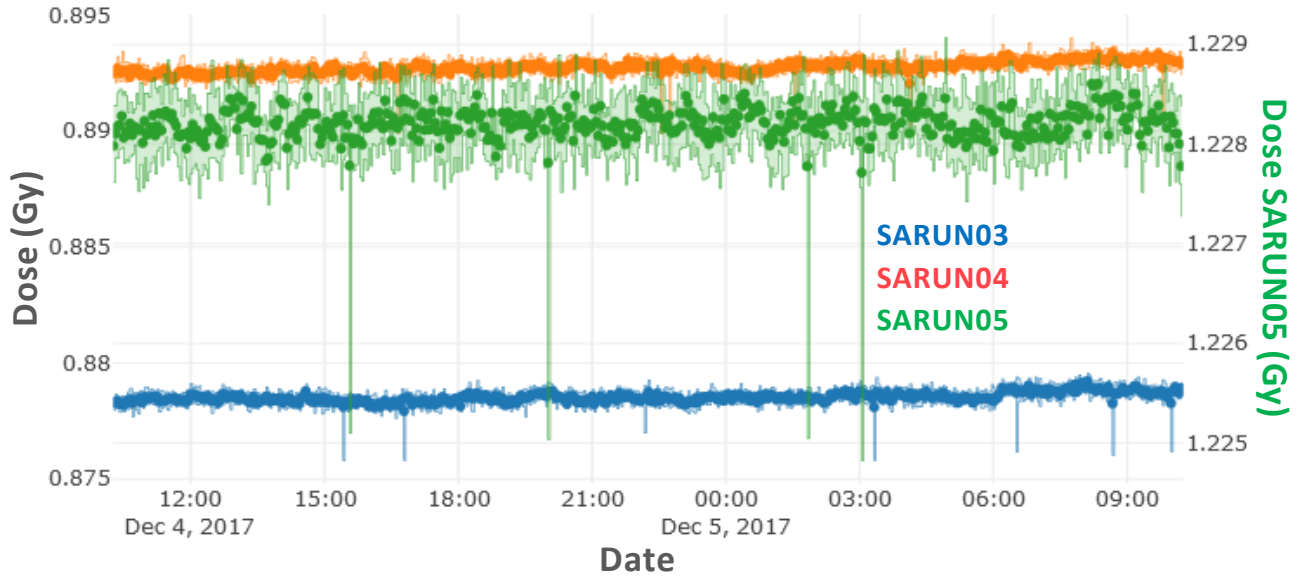

\* L. Froehlich, S. Grulja, F. Loehl, "DOSFET-L02: An advanced online dosimetry system for RadFET sensors", Proceedings of IBIC2013, TUPC45, 2013

- ARAMIS: 42x RadFETs → 13 DOSFET controllers
- ATHOS: 18x RadFETs → 4 DOSFET controllers

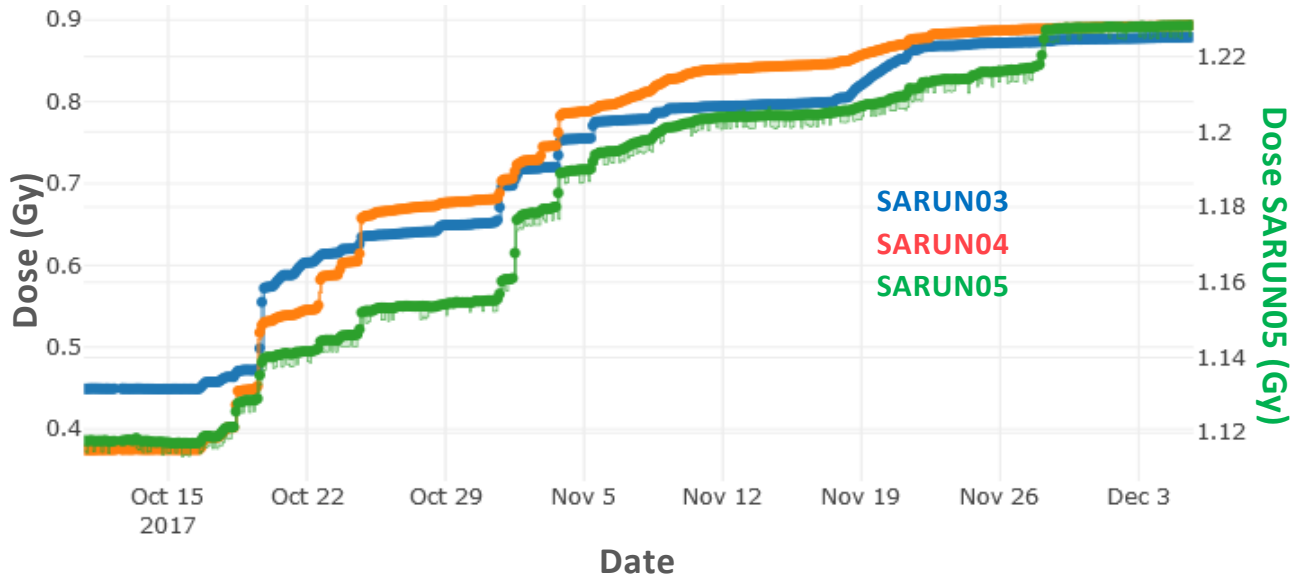

# Dose History

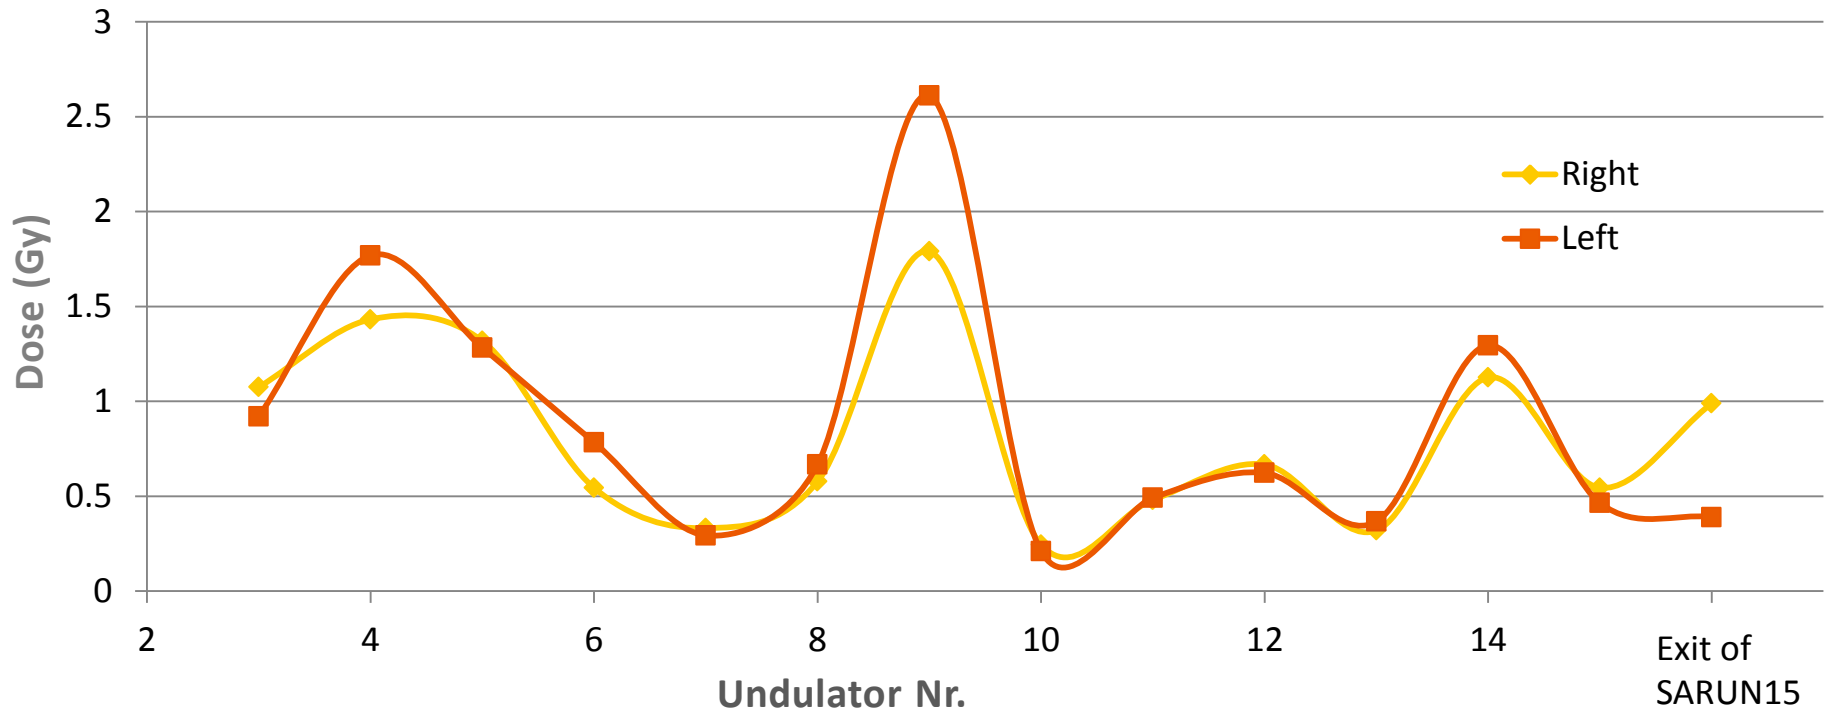

Stable FEL  
operation 24h

Long term  
accumulation

Accumulated dose until 19.02.2018 @ 11:10am

- Ordered:
  - custom USB3.0 cables (50m)
  - DOSFET controllers
- Installation:
  - Cabling from rack to tunnel
  - DOSFET controllers in racks
  - RadFETs on their PCB holders (in-house)
- Configuration & checks

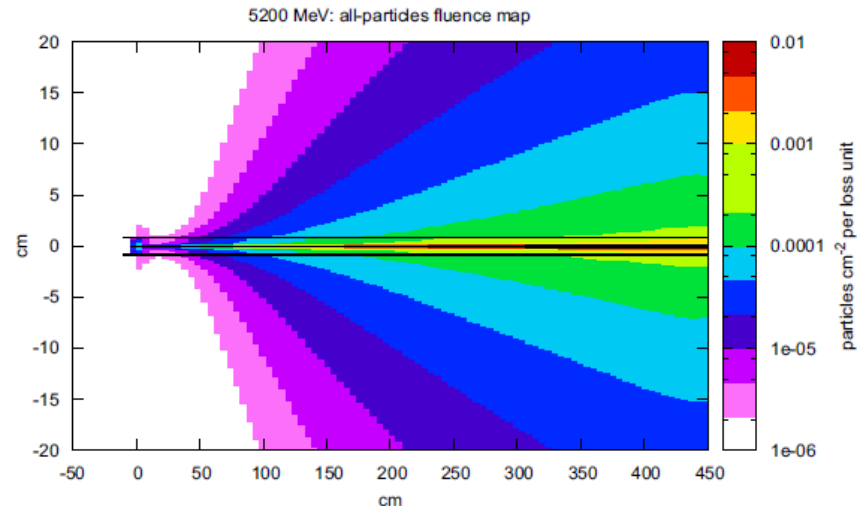

- Loss tracking due to:
  - Insertion of screens, collimators, slits
  - Beam alignment
  - Wire insertions
- Two types of loss monitors:
  - Scintillator based, for localized losses (BLM)
  - Optical fiber for tracking loss positions along the machine (LLM)

Schematic courtesy of L. Froehlich

**SARUN05**

**4<sup>th</sup> Undulator**  
**SARUN06**

# DAQ System Overview

- Analog front-end & digital backend developed at PSI
- Cost reduction: using same readout chain for all
- Common firmware and software solutions

ARAMIS + ATHOS = 28 Systems

## Beam loss monitor

## Longitudinal loss monitor

**MPS Algorithm:**

$$\frac{1}{2K} (avg_n \cdot (K - 1) + S_n)$$

$S_n$ : sum of PMT pulse from single bunch loss

$avg_n$ : previously calculated sum

K: factor for weighted average (filter length)

- Once generated Alarm remains active until condition is no longer fulfilled
- Calculations performed at 100Hz, independent of beam repetition rate

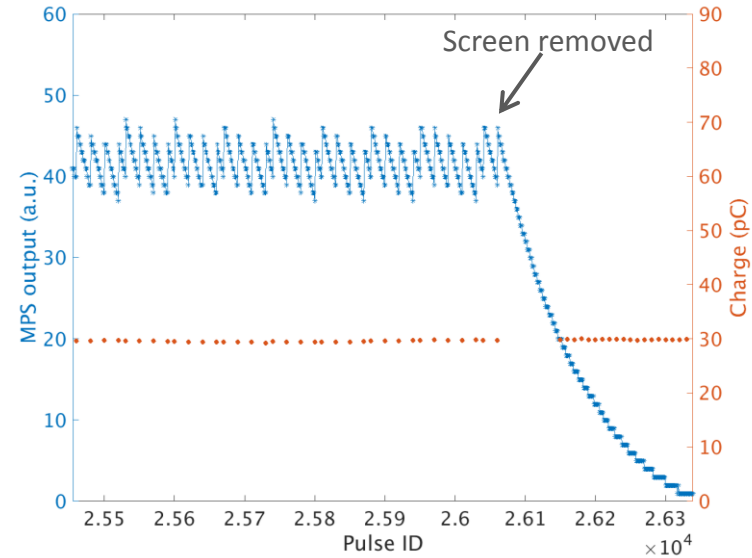

# Rate reduction concept

# Rate reduction in practice

- Dynamically change beam repetition rate
- Around Undulators alarm thresholds are set by looking at the dose rate measured by RadFETs

# Loss Monitor Panel

$$\frac{1}{2K} (avg_n \cdot (K-1) + S_n)$$

Work in progress

factor

seconds

- Installation of remaining:
  - Scintillator fibers and POF (rack to tunnel) for 17x BLMs (3x dogleg installed)
  - OF for 4x LLM (rack to tunnel and along beam pipe)
- Will use existing crates in technical gallery
- To be ordered: PAC piggy boards
- In-house: PMT detectors
- Configuration & checks

- Loss monitoring systems actively protecting ARAMIS from Day 1  
→ Systems handed over to Operations

## Important to remember:

- Certain channels are write protected → List of cleared personnel
- Work on timing system or restarting crates can mean changes are not configured on the firmware level → Requires intervention by cleared personnel
- After every system restart, have to make sure MPS settings are loaded correctly & systems initialized → Only cleared personnel!
- Setting gains for the first time requires careful observation of losses (invasive)
- Setting alarm thresholds is not straightforward and only refined through experience → ATHOS will require observation till beam reaches dump (2019)
- Sad demise of two PMTs → maintenance during shutdown helps recognizing issues that otherwise cannot be determined from control room

## Other than installation along ATHOS ...

- Firmware Upgrade:
  - Normalization by PMT gain factor (ready April 2018)
  - Mode switching (ready April 2018)
- 2-bunch commissioning at ARAMIS
- 100 Hz commissioning at ARAMIS: Minor adjustments to alarm thresholds
  
- Commissioning of ATHOS loss monitors:  
setting gains, setting ROIs (incl. 2-bunch), alarm thresholds
- Commissioning of ATHOS dose rate monitors:  
Check if all monitors are accumulating when losses are generated

*Depends on how far the beam is transmitted and if Undulators are ready for use*

This work has been possible thanks to the *entire* SwissFEL collaboration, especially:

Daniel Llorente  
Patrick Pollet  
Enrico Ebner  
Florian Loehl  
EBI group  
Edwin Divall

**Thank you for your attention**
