

# UV filter test on Aramis

Eugenio set up UV light on the last screen before PBPG at about 8 keV.

HAMP with no UV filter

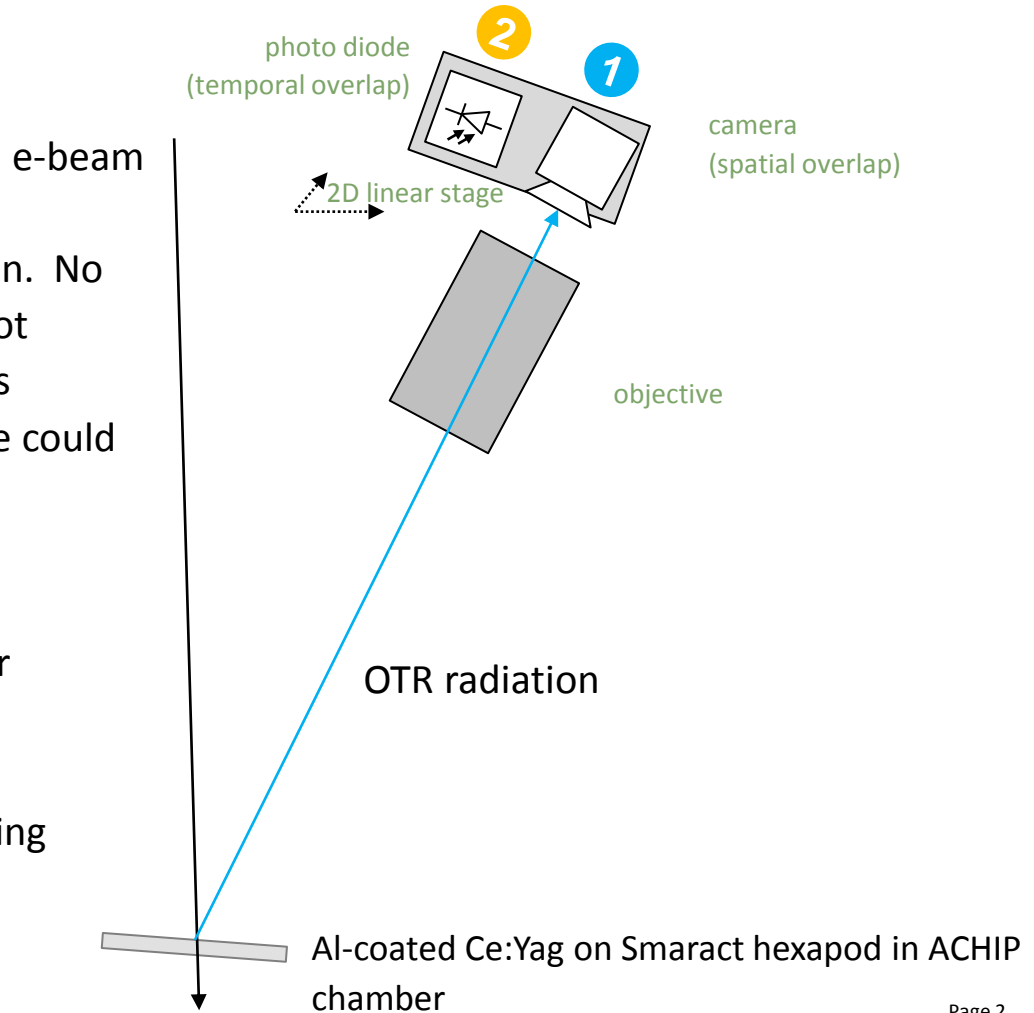

HAMP with UV filter

# OTR setup

We saw the OTR and even COTR radiation. No pictures possible because camera was not synchronized. Unfortunately, the diode's amplifier seems to have an issue, and we could not observe the signal on the diode.

May move the experiment from ACHIP chamber to the injector ACHIP DSCR, per Eugenio's suggestion.

Tilting of the mirror helped a lot in locating OTR.
