

Good Scientific Practice

Stine Korreman
Danish Center for Particle Therapy
Aarhus University Hospital

The screenshot shows the homepage of the RAPTOR website. At the top, there is a navigation bar with the RAPTOR logo on the left, a 'Contact us' button on the right, and a menu with 'Home', 'Projects', 'Recruitment', 'Members', 'Events', and 'News&Articles'. Below the navigation bar is a large hero section with a blue background featuring a grid pattern and a stylized human head. The main heading reads 'Real-Time Adaptive Particle Therapy Of Cancer (RAPTOR)'. Below this, a sub-heading states 'A MARIE SKŁODOWSKA-CURIE INNOVATIVE TRAINING NETWORK (ITN)'. The main text describes the project: 'RAPTOR brings together 13 Beneficiaries and 15 partner organizations with one aim in common: To bring adaptive particle therapy to the clinic.' At the bottom of the hero section, there is a 'Research projects' button. In the bottom right corner, there is a footer with the text 'Funded by the Horizon 2020 Framework Programme of the EU.' and logos for the European Union and Marie Curie.

Genome-Guided Adjuvant Cisplatin With Either Vinorelbine or Pemetrexed for Early Stage Non-Small Cell Lung Cancer

Tumour resection

Genomic profiling

Choice of treatment arm

Arms
Experimental: A Resected tumor will be used for genomic expression profiling. Patients with a genomic expression pattern suggestive of vinorelbine sensitivity will be given cisplatin+vinorelbine.
Experimental: B Resected tumor will be used for genomic expression profiling. Patients with a genomic expression pattern suggestive of pemetrexed sensitivity will be given cisplatin+pemetrexed.

> N Engl J Med. 2006 Aug 10;355(6):570-80. doi: 10.1056/NEJMoa060467.

A genomic strategy to refine prognosis in early-stage non-small-cell lung cancer

Anil Potti¹, Sayan Mukherjee, Rebecca Petersen, Holly K Dressman, Andrea Bild, Jason Koontz, Robert Kratzke, Mark A Watson, Michael Kelley, Geoffrey S Ginsburg, Mike West, David H Harpole Jr, Joseph R Nevins

Recruitment started 2007:

Choice of treatment arm

Arms
Experimental: A Resected tumor will be used for genomic expression profiling. Patients with a genomic expression pattern suggestive of vinorelbine sensitivity will be given cisplatin+vinorelbine.
Experimental: B Resected tumor will be used for genomic expression profiling. Patients with a genomic expression pattern suggestive of pemetrexed sensitivity will be given cisplatin+pemetrexed.

Danish Code of Conduct for Research Integrity – by Ministry of Higher Education and Science

Policy for research integrity, freedom of research and responsible conduct of research at Aarhus University

Policy for research integrity, freedom of research and responsible conduct of research at Aarhus University

Preface

Aarhus University is a world-class university with an international reputation for excellent research, outstanding research-based degree programmes and value-adding collaboration with private companies and public government authorities and institutions.

The highest quality demands honesty, transparency and responsibility in all of the university's research activities, with respect for freedom of research and in a research climate characterised by freely open and critical academic discussions within and across different fields of research and research traditions.

Aarhus University endorses the Danish Code of Conduct for Research Integrity, which is based on international declarations and principles for research integrity, freedom of research and responsible conduct of research. This means that Aarhus University:

- Safeguards the freedom of research of the university and the individual researcher
- Has clearly defined standards for the responsible conduct of research, including how to ensure honesty, transparency and responsibility in the execution of research
- Instructs in and advises on research integrity, freedom of research and responsible conduct of research
- Has clear rules and procedures for handling cases regarding research misconduct, questionable research practices and pressure on freedom of research.

The policy recognises all disciplines and contributes to a common understanding of research integrity, freedom of research and responsible conduct of research.

1. Research integrity

Singapore Statement on Research Integrity

Preamble. The value and benefits of research are vitally dependent on the integrity of research. While there can be and are national and disciplinary differences in the way research is organized and conducted, there are also principles and professional responsibilities that are fundamental to the integrity of research wherever it is undertaken.

PRINCIPLES

Honesty in all aspects of research
Accountability in the conduct of research
Professional courtesy and fairness in working with others
Good stewardship of research on behalf of others

RESPONSIBILITIES

1. Integrity: Researchers should take responsibility for the trustworthiness of their research.

2. Adherence to Regulations: Researchers should be aware of and adhere to regulations and policies related to research.

3. Research Methods: Researchers should employ appropriate research methods, base conclusions on critical analysis of the evidence and report findings and interpretations fully and objectively.

4. Research Records: Researchers should keep clear, accurate records of all research in ways that will allow verification and replication of their work by others.

5. Research Findings: Researchers should share data and findings openly and promptly, as soon as they have had an opportunity to establish priority and ownership claims.

6. Authorship: Researchers should take responsibility for their contributions to all publications, funding applications, reports and other representations of their research. Lists of authors should include all those and only those who meet applicable authorship criteria.

7. Publication Acknowledgement: Researchers should acknowledge in publications the names and roles of those who made significant contributions to the research, including writers, funders, sponsors, and others, but do not meet authorship criteria.

8. Peer Review: Researchers should provide fair, prompt and rigorous evaluations and respect confidentiality when reviewing others' work.

9. Conflict of Interest: Researchers should disclose financial and other conflicts of interest that could compromise the trustworthiness of their work in research proposals, publications and public communications as well as in all review activities.

10. Public Communication: Researchers should limit professional comments to their recognized expertise when engaged in public discussions about the application and importance of research findings and clearly distinguish professional comments from opinions based on personal views.

11. Reporting Irresponsible Research Practices: Researchers should report to the appropriate authorities any suspected research misconduct, including fabrication, falsification or plagiarism, and other irresponsible research practices that undermine the trustworthiness of research, such as carelessness, improperly listing authors, failing to report conflicting data, or the use of misleading analytical methods.

12. Responding to Irresponsible Research Practices: Research institutions, as well as journals, professional organizations and agencies that have commitments to research, should have procedures for responding to allegations of misconduct and other irresponsible research practices and for protecting those who report such behavior in good faith. When misconduct or other irresponsible research practice is confirmed, appropriate actions should be taken promptly, including correcting the research record.

13. Research Environments: Research institutions should create and sustain environments that encourage integrity through education, clear policies, and reasonable standards for advancement, while fostering work environments that support research integrity.

14. Societal Considerations: Researchers and research institutions should recognize that they have an ethical obligation to weigh societal benefits against risks inherent in their work.

The global level: The Singapore Statement on Research Integrity

The objective of the Singapore statement is to promote global research integrity:

"... social, political, cultural, and economic differences among nations ... affect the conduct of research and influence ethical norms ..."

"... the Singapore Statement acknowledges these differences, but maintains that there are some common standards for research ethics that transcend national boundaries"

"... the intent of the Singapore Statement is to provide ethical guidance which research organizations, governments, and scientists can use to develop policies, regulations, and codes of conduct"

Singapore Statement on Research Integrity

Preamble. The value and benefits of research are vitally dependent on the integrity of research. 13. Research Environments: Research institutions should create and sustain environments that encourage integrity through education, clear policies, and reasonable standards for advancement, while fostering work environments that support research integrity.

14. Societal Considerations: Researchers and research institutions should recognize that they have an ethical obligation to weigh societal benefits against risks inherent in their work.

Responsibilities are phrased to be operational

Examples:

Research records: Keep a logbook of your research

Authorship: Adhere to authorship criteria – include all authors who meet criteria

Conflict of interest: Disclose fully all potential conflicts, in all communications

What constitutes major misconduct?

- **Fabrication**

“making up results and recording them as if they were real”

- **Falsification**

“manipulating research materials, equipment or processes or changing, omitting or suppressing data or results without justification”

- **Plagiarism**

“using other people’s work and ideas without giving proper credit to the original source”

How frequent is major misconduct?

In Denmark, scientific misconduct is regulated by law, and handled by the Danish Committee on Research Misconduct.

In 2020, decisions were made in 15 cases – scientific misconduct was found in 7 cases.

In 2019, decisions were made in 13 cases – scientific misconduct was found in 2 cases.

Of these 9 cases, plagiarism was the most common cause – six of them were plagiarism in PhD dissertations.

Questionable research practices

- Manipulating **authorship** or denigrating the role of other researchers in publications.
- Re-publishing substantive parts of one's own earlier publications, including translations, without duly acknowledging or citing the original ('**self-plagiarism**').
- **Citing selectively** to enhance own findings or to please editors, reviewers or colleagues.
- **Withholding research** results.
- Allowing funders/sponsors to **jeopardise independence** in the research process or reporting of results so as to introduce or promulgate bias.
- **Expanding unnecessarily** the bibliography of a study.
- **Accusing** a researcher of misconduct or other violations in a malicious way.
- **Misrepresenting** research achievements.
- **Exaggerating** the importance and practical applicability of findings.
- **Delaying** or inappropriately **hampering** the work of other researchers.
- **Misusing seniority** to encourage violations of research integrity.
- **Ignoring putative violations** of research integrity by others or covering up inappropriate responses to misconduct or other violations by institutions.
- Establishing or supporting journals that undermine the quality control of research ('**predatory journals**').

Problems from daily life – data

You do several measurement series to verify a new model developed in your group. One of the measurement series does not give the results you expect, and you discuss with the group how to proceed. You do not have material to repeat the measurement. Several explanations for error in the experiment setup are suggested, and the lab head ends up stating that most likely one part of the equipment gave an erroneous readout.

You have to decide whether to throw out the measurements, or to report them as part of your results.

Problems from daily life – exaggeration

You have been given the opportunity to present your results at a high-profile scientific conference. When the conference approaches, parts of your analysis do not demonstrate significance towards your expected result. Based on the parts that do demonstrate significance and the overall trend of the analysis, you all have a clear feeling that your expected result will hold up once more data is added.

You have to decide whether to present the non-significant results explicitly, or to focus more qualitatively on the overall trends.

Problems from daily life – authorship

You are writing a manuscript as first author, on a study which was performed in collaboration with a company which manufactures equipment used in your research. The company representative who was involved in the study has contributed to reading and editing the manuscript, and indeed did end up phrasing parts of the text, but states that she does not want to be coauthor – it is fine that you just mention her in the acknowledgments.

You have to decide whether to include her in the author list or not.

Break-out group discussions

- You will be divided in groups of 6-7 participants, and moved to break-out rooms
- You will have 15 minutes for discussion in the groups
- **The groups will be presented with two separate dilemmas for discussion, concerning authorship and data analysis**
- **Along with each dilemma, you will be given different options for responses/reactions**
 - **there is not one correct answer, rather you may use the options to discuss the pro's and con's**
 - **feel free to also give your own alternative response options**
- **Take approximately 6-7 minutes to discuss each dilemma**
- **For each dilemma, note down one short key consideration you find to be important**

Dilemma 1:

You are writing a manuscript as first author and are approached by a senior author who asks you to include an external colleague on the author list. The external colleague has been peripherally involved in discussion of some of the ideas in the paper but has not participated directly. However, the senior author argues that there is a general good collaboration and that the goodwill of the external colleague may be useful in the future.

Options:

1. You follow the suggestion of the more senior author.
2. You send the manuscript to the suggested new co-author, and ask for input for both analysis, results and text.
3. You ask another independent colleague for advice, which you then follow.
4. You decline and report the senior author to the department head.

Dilemma 2:

You are writing a manuscript which is a continuation of previous work which has already been published by you. During data analysis for this new publication, you discover an error in your previous data analysis. The senior author of the first paper does not find the error to be of high importance, as it does not change the conclusion and was not noticed in previous peer review.

Options:

1. You just continue the new manuscript, using the corrected analysis.
2. You use the corrected analysis in the new paper and incorporate an explicit mention of the error into the text.
3. You write an independent erratum to your first paper and insist that it be submitted.
4. You send the question to all co-authors of both papers and go with the majority vote.

Break-out group discussion follow-up

Dilemma 1 “authorship request”:

<Please use mentimeter to state a short sentence on an appropriate response or consideration>

Break-out group discussion follow-up

Dilemma 2 “data analysis”:

<Please use mentimeter to state a short sentence on an appropriate response or consideration>

WMA DECLARATION OF HELSINKI – ETHICAL PRINCIPLES FOR MEDICAL RESEARCH INVOLVING HUMAN SUBJECTS

Adopted by the 18th WMA General Assembly, Helsinki, Finland, June 1964 and amended by the:

29th WMA General Assembly, Tokyo, Japan, October 1975

59th WMA General Assembly, Seoul, Republic of Korea, October 2008
64th WMA General Assembly, Fortaleza, Brazil, October 2013

Preamble

1. The World Medical Association (WMA) has developed the Declaration of Helsinki as a statement of ethical principles for medical research involving human subjects, including research on identifiable human material and data.

The Declaration is intended to be read as a whole and each of its constituent paragraphs should be applied with consideration of all other relevant paragraphs.

2. Consistent with the mandate of the WMA, the Declaration is addressed primarily to physicians. The WMA encourages others who are involved in medical research involving human subjects to adopt these principles.

General Principles

3. The Declaration of Geneva of the WMA binds the physician with the words, "The health of my patient will be my first consideration," and the International Code of Medical Ethics declares that, "A physician shall act in the patient's best interest when providing medical care."

4. It is the duty of the physician to promote and safeguard the health, well-being and rights of patients, including those who are involved in medical research. The physician's knowledge and conscience are dedicated to the fulfilment of this duty.

5. Medical progress is based on research that ultimately must include studies involving human subjects.

6. The primary purpose of medical research involving human subjects is to understand the causes, development and effects of diseases and improve preventive, diagnostic and therapeutic interventions (methods, procedures and treatments). Even the best proven interventions must be evaluated continually through research for their safety, effectiveness, efficiency, accessibility and quality.

7. Medical research is subject to ethical standards that promote and ensure respect for all human subjects and protect their health and rights.

8. While the primary purpose of medical research is to generate new knowledge, this goal can never take precedence over the rights and interests of individual research subjects.

9. It is the duty of physicians who are involved in medical research to protect the life, health, dignity, integrity, right to self-determination, privacy, and confidentiality of personal information of research subjects. The responsibility for the protection of research subjects must always rest with the physician or other health care professionals and never with the research subjects, even though they have given consent.

10. Physicians must consider the ethical, legal and regulatory norms and standards for research involving human subjects in their own countries as well as applicable international norms and standards. No national or international ethical, legal or regulatory requirement should reduce or eliminate any of the protections for research subjects set forth in this Declaration.

11. Medical research should be conducted in a manner that minimises possible harm to the environment.

12. Medical research involving human subjects must be conducted only by individuals with the appropriate ethics and scientific education, training and qualifications. Research on patients or healthy volunteers requires the supervision of a competent and appropriately qualified physician or other health care professional.

Working with human subjects requires special considerations

The World Medical Association Declaration of Helsinki sets guiding principles for ethical standards, including e.g.:

- Protecting Patient Health - Declaration of Geneva emphasizes "the health of my patient will be my first consideration"
- Knowledge Cannot Trample Rights - "This goal can never take precedence over the rights and interests of individual research subjects"
- "Medical research involving human subjects may only be conducted if the importance of the objective outweighs the risks and burdens to the research subjects."
- "Participation by individuals capable of giving informed consent as subjects in medical research must be voluntary."

Guideline for good clinical practice E6(R2)

European level – European Medicines Agency

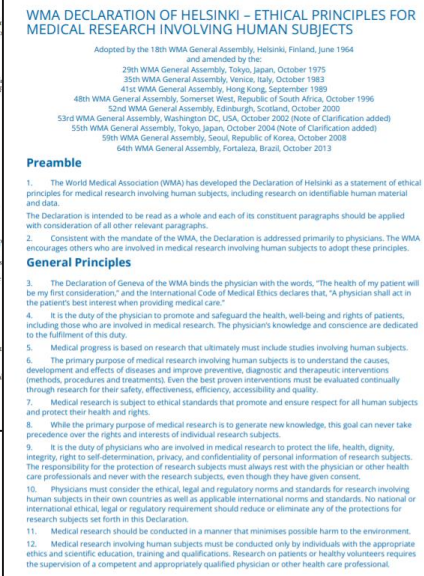

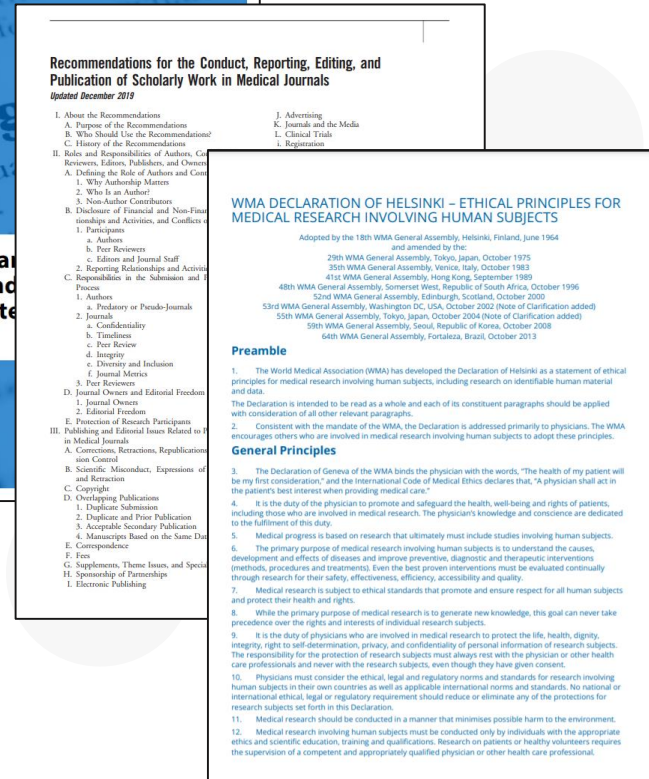

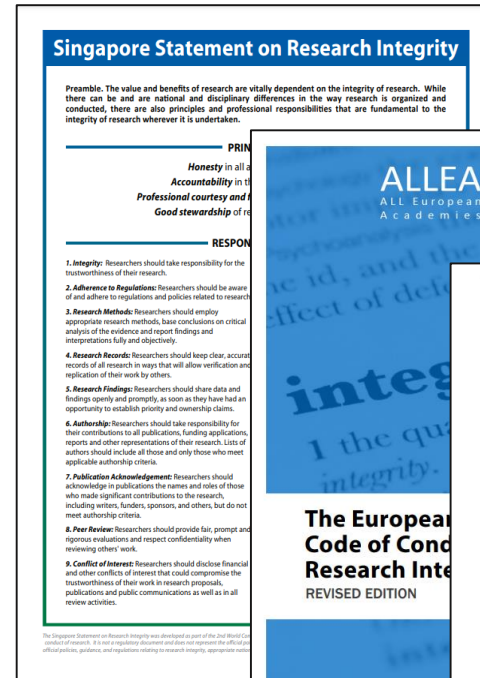

“Clinical trials should be conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki ...”

The guidelines describe

- Principles of good clinical practice
- Roles of responsibilities of involved entities;
 - Institutional review board
 - Investigator
 - Sponsor
- Requirements for clinical trial protocols

Essential documents to know

- Singapore Statement on Research Integrity, drafted at the Second World Conference on Research Integrity
- The European Code of Conduct for Research Integrity – by ALLEA, the European Federation of Academies of Sciences and Humanities
- Recommendations for the Conduct, Reporting, Editing, and Publication of Scholarly Work in Medical Journals (also known as the Vancouver Convention) - by the International Committee of Medical Journal Editors (ICMJE)
- World Medical Association Declaration of Helsinki – Ethical Principles For Medical Research Involving Human Subjects

Everybody makes mistakes

Mistakes should be handled in accordance with good scientific practice.

Errors in published data, analyses, results, conclusions, can be handled by publishing addenda/errata or ultimately by retracting.

Exploring the quantum speed limit with computer games

“We show that human players are able to find solutions to difficult problems associated with the task of quantum computing⁶. Players succeed where purely numerical optimization fails, and analyses of their solutions provide insights into the problem of optimization of a more profound and general nature.”

Everybody makes mistakes

Mistakes should be handled in accordance with good scientific practice.

Errors in published data, analyses, results, conclusions, can be handled by publishing addenda/errata or ultimately by retracting.

During this time, the results were contested and questioned by several independent scientists. Delay in sharing code was severely criticised.

The screenshot shows a web browser view of a Nature journal article. At the top, the text "nature 2016" is visible. Below it, "nature 2020" is displayed in a larger font. Navigation links include "Explore content", "About the journal", and "Publish with us". The breadcrumb trail reads "nature > addenda > article". The article title is "Editorial Expression of Concern: Exploring the quantum speed limit with computer games", with a sub-header "Addendum | Published: 05 May 2020". Two red arrows point from the text above to the "nature 2016" and "nature 2020" text.

“The authors have alerted the editors of Nature to an error in the code underlying the work in this Letter, and have informed us that this error will have an impact on the conclusions that can reliably be drawn. Nature is working with the authors to resolve the matter, but in the meantime, readers are cautioned against using results from this Letter.”

Everybody makes mistakes

Mistakes should be handled in accordance with good scientific practice.

Errors in published data, analyses, results, conclusions, can be handled by publishing addenda/errata or ultimately by retracting.

During this time, the results were contested and questioned by several independent scientists. Delay in sharing code was severely criticised.

The screenshot shows a series of overlapping browser window captures. The top-most window shows the 'nature 2016' logo. Below it, a window shows 'nature 2020' with the word 'Explore' to the left. The next window shows 'nature 2020' with 'Explore' and 'nature' to the left. The bottom-most window shows the journal's navigation menu: 'Explore content', 'About the journal', and 'Publish with us'. Below the menu is the breadcrumb 'nature > retractions > article', followed by 'Retraction Note | Published: 22 July 2020', and the main title: 'Retraction Note: Exploring the quantum speed limit with computer games'. Two red arrows point from the text above to the 'nature 2016' and 'nature 2020' logos.

“We, the authors, are regretfully retracting this Article owing to an error in our computer code that means the quantitative results reported are not valid.”

Everybody makes mistakes

It is not the mistake itself that is a problem – it is how you handle it!

When in doubt – consult your guidelines and ask your peers, your supervisor, your mentor, and/or an independent advisor.

Make yourself acquainted with resources available to you

Example Aarhus University:

The screenshot displays the 'RESEARCH SUPPORT AND COLLABORATION' page on Aarhus University's website. The page is in Danish and features a dark blue header with the text 'STAFF SERVICE AT AU » RESEARCH SUPPORT AND COLLABORATION' and a search bar. A breadcrumb trail indicates the current location: 'AU » Staff » Staff Service » Research support and collaboration » Responsible conduct of research and freedom of research'. The main content area is titled 'Responsible conduct of research and freedom of research' and includes an introductory paragraph about research integrity and a list of resources. On the left, a sidebar menu lists various support services, with 'Responsible conduct of research and freedom of research' highlighted. On the right, there are several callout boxes: 'Do you need guidance?' with contact information for advisers, a video player for 'Introduction to responsible conduct of research at Aarhus University', and 'Ground rules for research collaboration with an external party'. A 'Related links' section at the bottom right points to 'AU's information security policy'.

Responsible conduct of research and freedom of research

Research is the foundation for all activities at Aarhus University. For this reason, we strive to ensure the reliability and integrity of our research. This entails that everyone who conducts research at Aarhus University must act in accordance with the basic principles that constitute the foundation for all research integrity.

Aarhus University works to ensure that research is conducted responsibly and to safeguard the freedom of research of the university and the individual researcher in different ways.
