

# Materials for QA

Luigi Vigani  
Oxford in-person meeting  
16/11/2021

# Chip QA (probe station)

## PC requirements

- Linux (better OpenSUSE 15.3)
- Mupix8\_daq repository

Everything apart from probe card  
already in Oxford

# Chip QA (probe station)

- 2 possibilities
  - Probe wafer before processing
    - Easier to perform
    - Very early in production chain (thinning and dicing not taken into account)
  - Probe wafer after processing
    - More difficult
      - Wafer on blue tape
      - Chips move from initial position -> pattern recognition crucial
    - Still some chip handling afterwards
- Ideally one would want to test single chips as far as possible into the production chain

# Chips QA (single chip needle card)

HD is in touch with PTSL for the development of a single chip needle card

Technically feasible

Experience from HD ATLAS group

One chip inside the box

Press down handle

Test

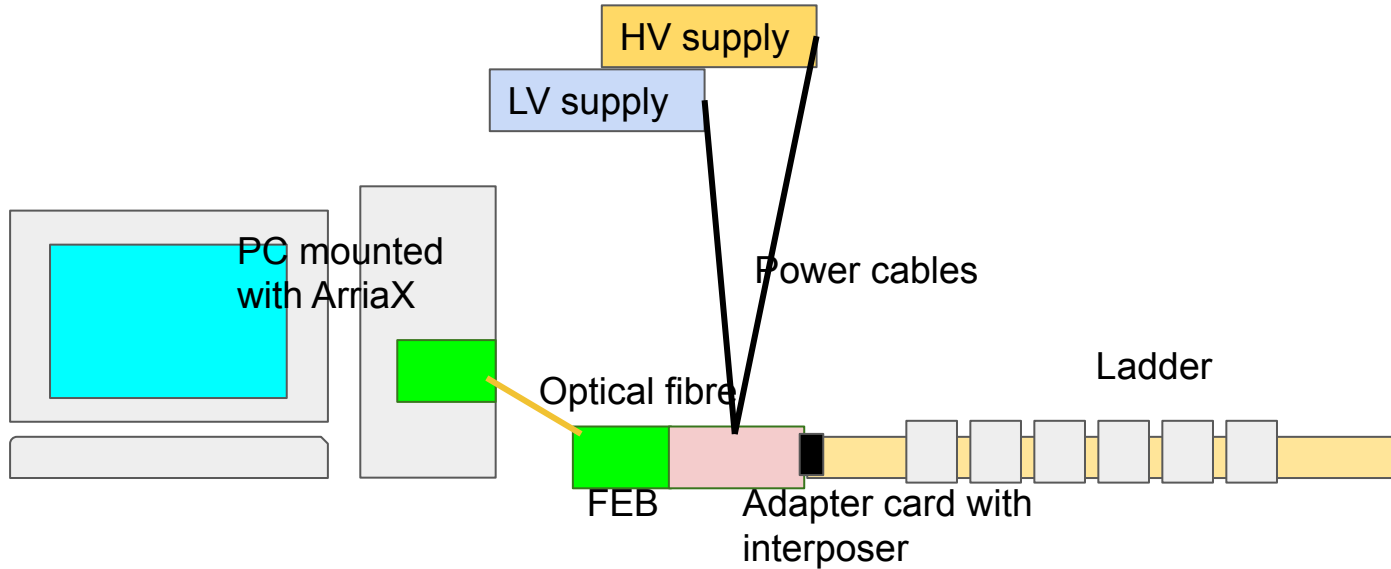

Single chips must be anyway handled to be put on gantree: one can perform test here

# Single chip QA: what to verify

- IV curve
- Power up
- Configurability
- Data transmission
- Injection
- Source/laser (possibly)

# Ladder/Module QA

Adapter cards (and power cables with it) still to be designed

Requirement for PC

- Linux (preferably OpenSUSE 15.3)
- Online (MIDAS based) repository
- Quartus

FEB brought to Oxford this week  
ArriaX to purchase  
Adapter card to be designed

# Ladder/Module QA: what to verify

- Connections
- Chip functionalities (test each chip in single chip mode)
- Temperature...?
- Mechanics...?
