Science IT for  
the SLS 2.0  
Upgrade Project

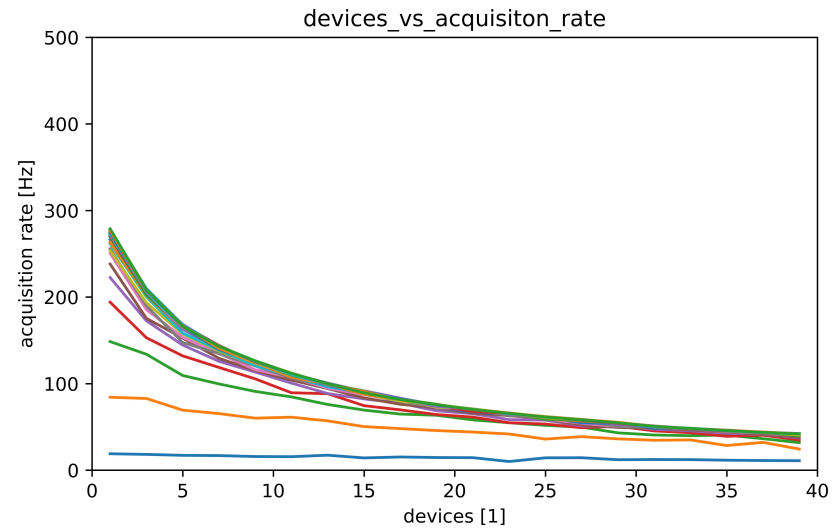

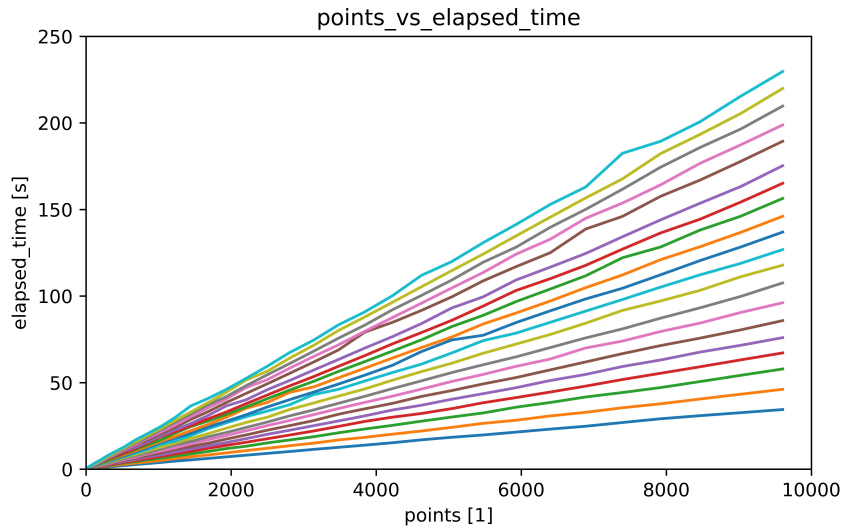

## BLISS Control and data architecture

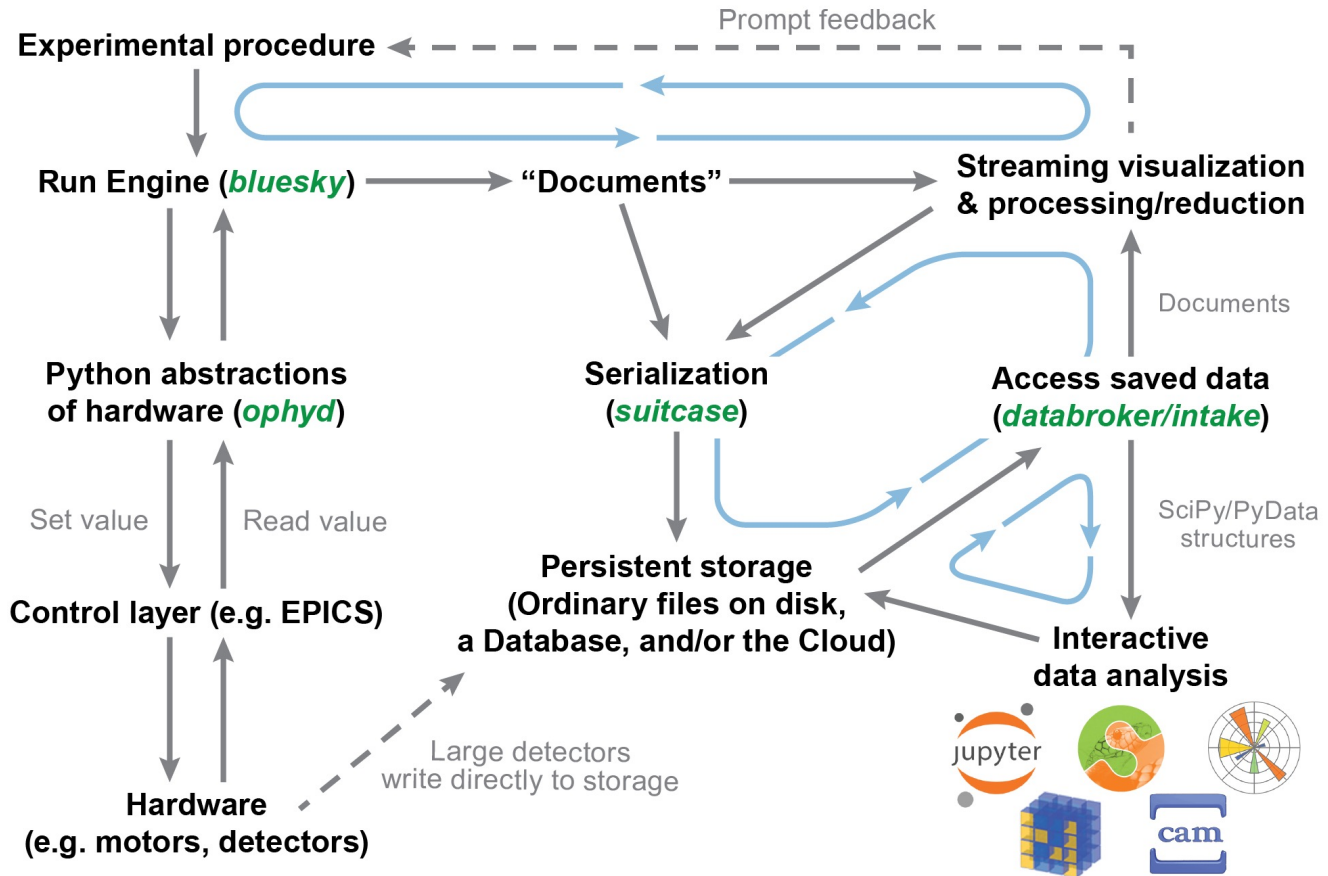

## Performance analysis using a 2D grid scan (mesh scan)

- simulated devices (single value readout)
- removed waiting times (with support from BLISS developers)

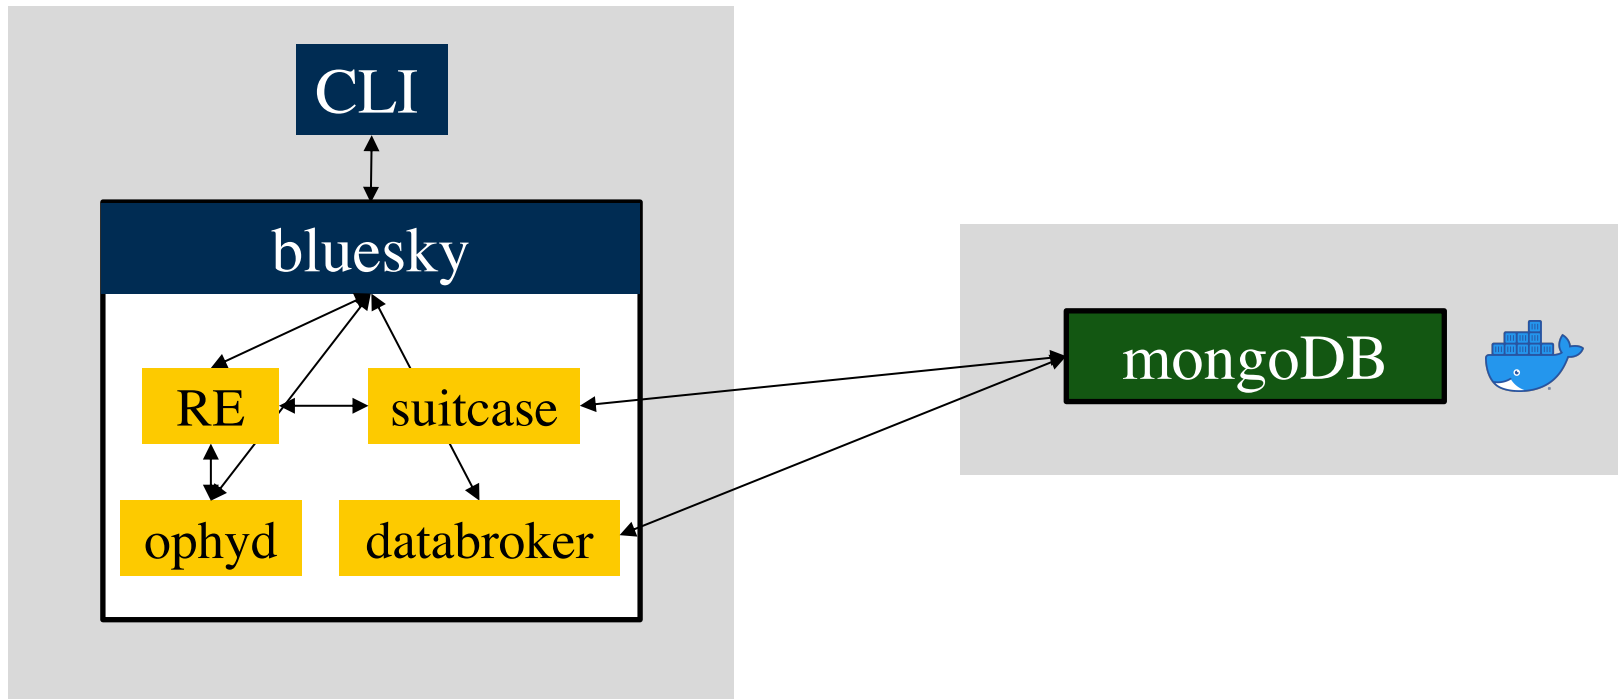

- Pros:
  - config management
  - data analysis does not influence the performance of the current data acquisition (via redis subscription)
  - checks a lot of boxes on our functional requirements list (multi-user, UIs, data pipelines...)
  
- Cons:
  - “All-in-one” package without clearly defined boundaries of individual components -> difficult to navigate through the code base
  - many dependencies
  - recommended developer onboarding ~3 months
    - unlikely that beamline scientists will be able to contribute to the development

# “Vanilla” bluesky

# Publishing to Kafka

## Performance analysis using a 2D grid scan (mesh scan)

- simulated devices (single value readout)
- removed waiting times

| Devices |    |    |    |    |  |  |  |  |  |
|---------|----|----|----|----|--|--|--|--|--|
| 1       | 9  | 17 | 25 | 33 |  |  |  |  |  |
| 3       | 11 | 19 | 27 | 35 |  |  |  |  |  |
| 5       | 13 | 21 | 29 | 37 |  |  |  |  |  |
| 7       | 15 | 23 | 31 | 39 |  |  |  |  |  |

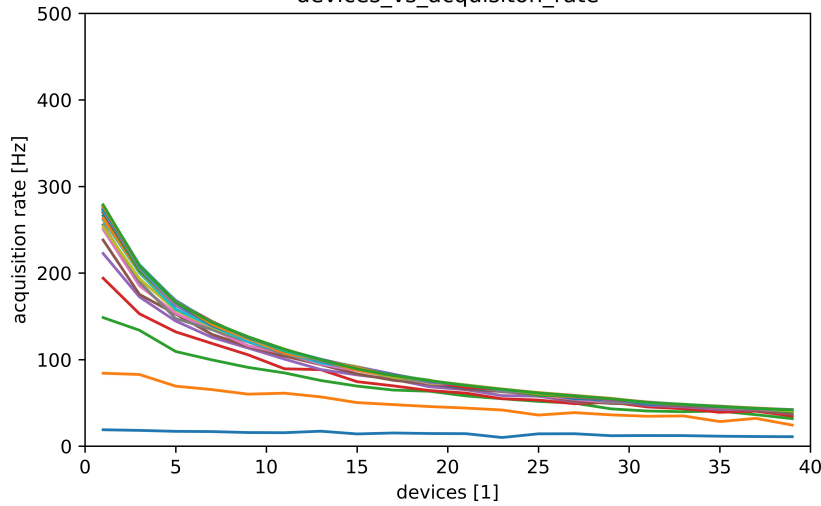

| Points |     |      |      |      |      |      |  |  |  |  |  |
|--------|-----|------|------|------|------|------|--|--|--|--|--|
| 4      | 289 | 1024 | 2209 | 3844 | 5929 | 7921 |  |  |  |  |  |
| 25     | 400 | 1225 | 2500 | 4225 | 6400 | 8464 |  |  |  |  |  |
| 64     | 529 | 1444 | 2809 | 4624 | 6889 | 9025 |  |  |  |  |  |
| 121    | 676 | 1681 | 3136 | 5041 | 7396 | 9604 |  |  |  |  |  |
| 196    | 841 | 1936 | 3481 | 5476 |      |      |  |  |  |  |  |

- Pros:
  - simplicity
  - modular structure (ophyd, bluesky, suitcase, databroker...)
  - very few dependencies
  
- Cons:
  - high memory usage
  - state objects propagate through the entire system (difficult to debug)
  - no config management
  - suggested user-management layer comes with a new CLI (and sacrifices most of bluesky's features)
  - no data management; everyone has access to everything

# BLISS and Bluesky

## BLISS

# Lessons learned from the tests

- *A dedicated hardware abstraction layer may lead to a cleaner solution.*
- *Components should be kept small and clearly separated (-> microservices).*
- *Avoid propagating state objects through the entire system.*
- *Embed authorization and authentication from the beginning.*
- *Be aware of the external dependencies. Remove unnecessary dependencies.*
- *Data analysis should be structurally decoupled from scan orchestration.*

A potential direction...

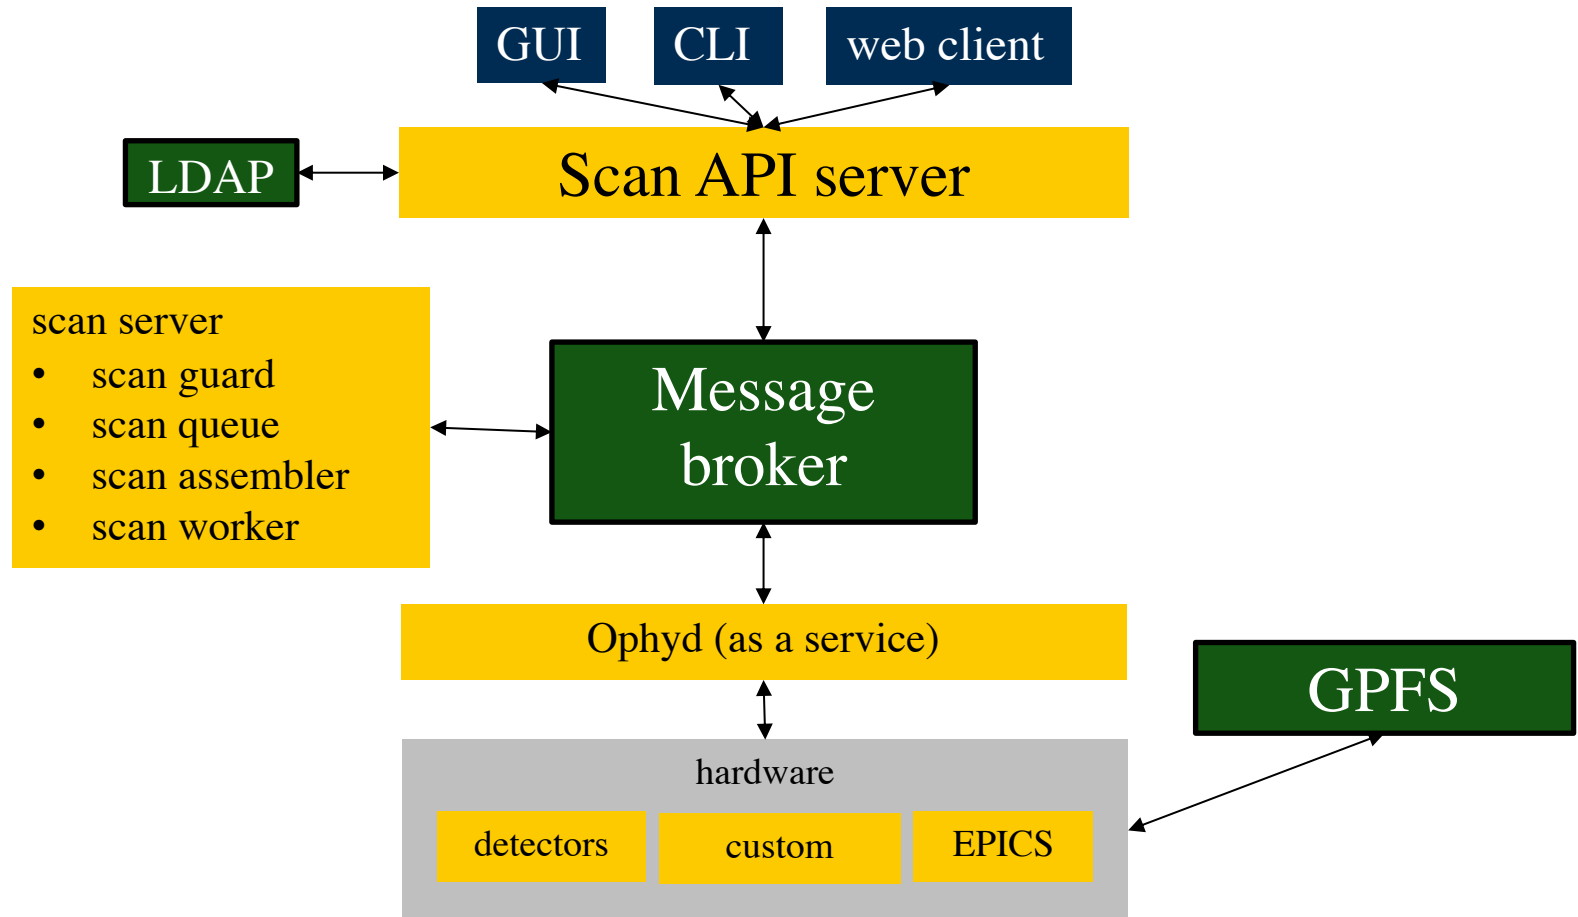

# Bluesky “enhanced”

## Advantages:

- Unified API between clients and the BEC system
- If needed, the scripting language can be easily changed in the future
- Easy to integrate with facility-specific DAQ components
- Smaller, more manageable and better maintainable services
- If needed, the system is highly scalable

# Bluesky “enhanced”

Statements by the Bluesky core dev team

The Bluesky Collaboration is moving its development focus from modular *libraries* to modular *services*. The work proposed by PSI would be beneficial to that effort.

In retrospect, we should have worked in a service-client design on the acquisition side earlier [...]

# Potential direction: Ptychographic tomography

Scan API server

scan server
