SciCat Present and Future

NOBUGS 2022

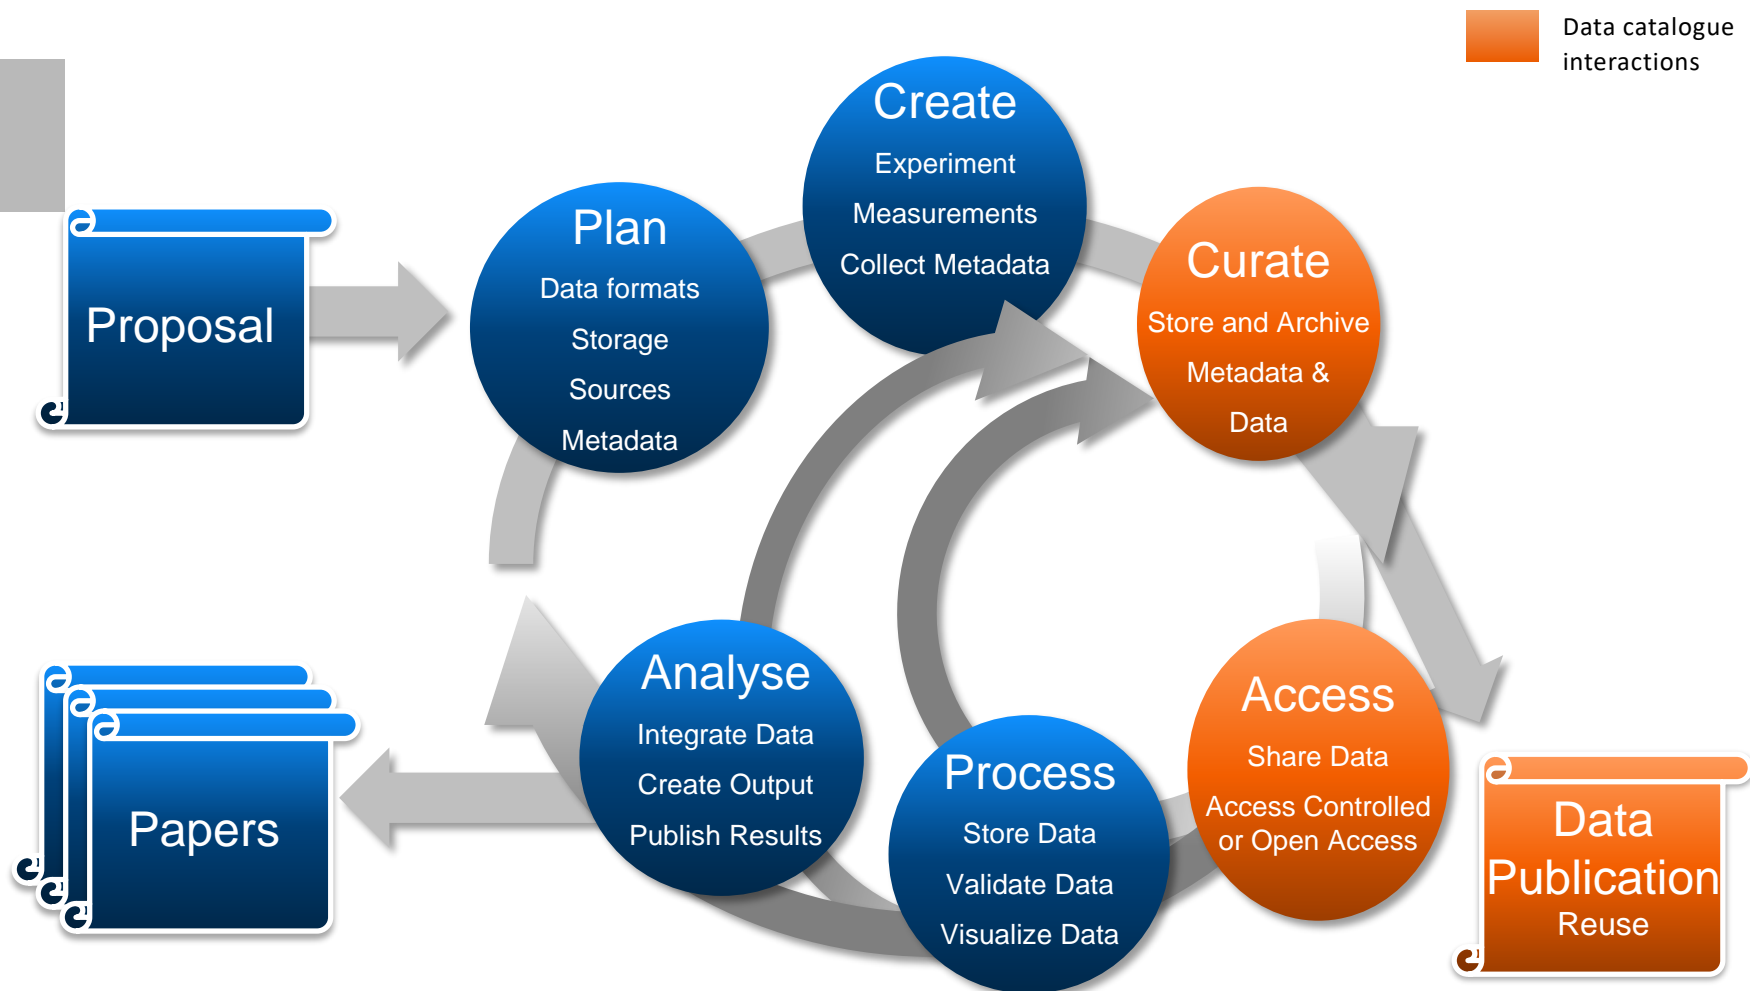

Paul Scherer Institute, Villigen, Switzerland

- The role of SciCat
- The user's perspective
- The developer/maintainer's perspective
- The beamline scientist/ingestor's perspective

A typical user journey

Interactions with the data catalogue

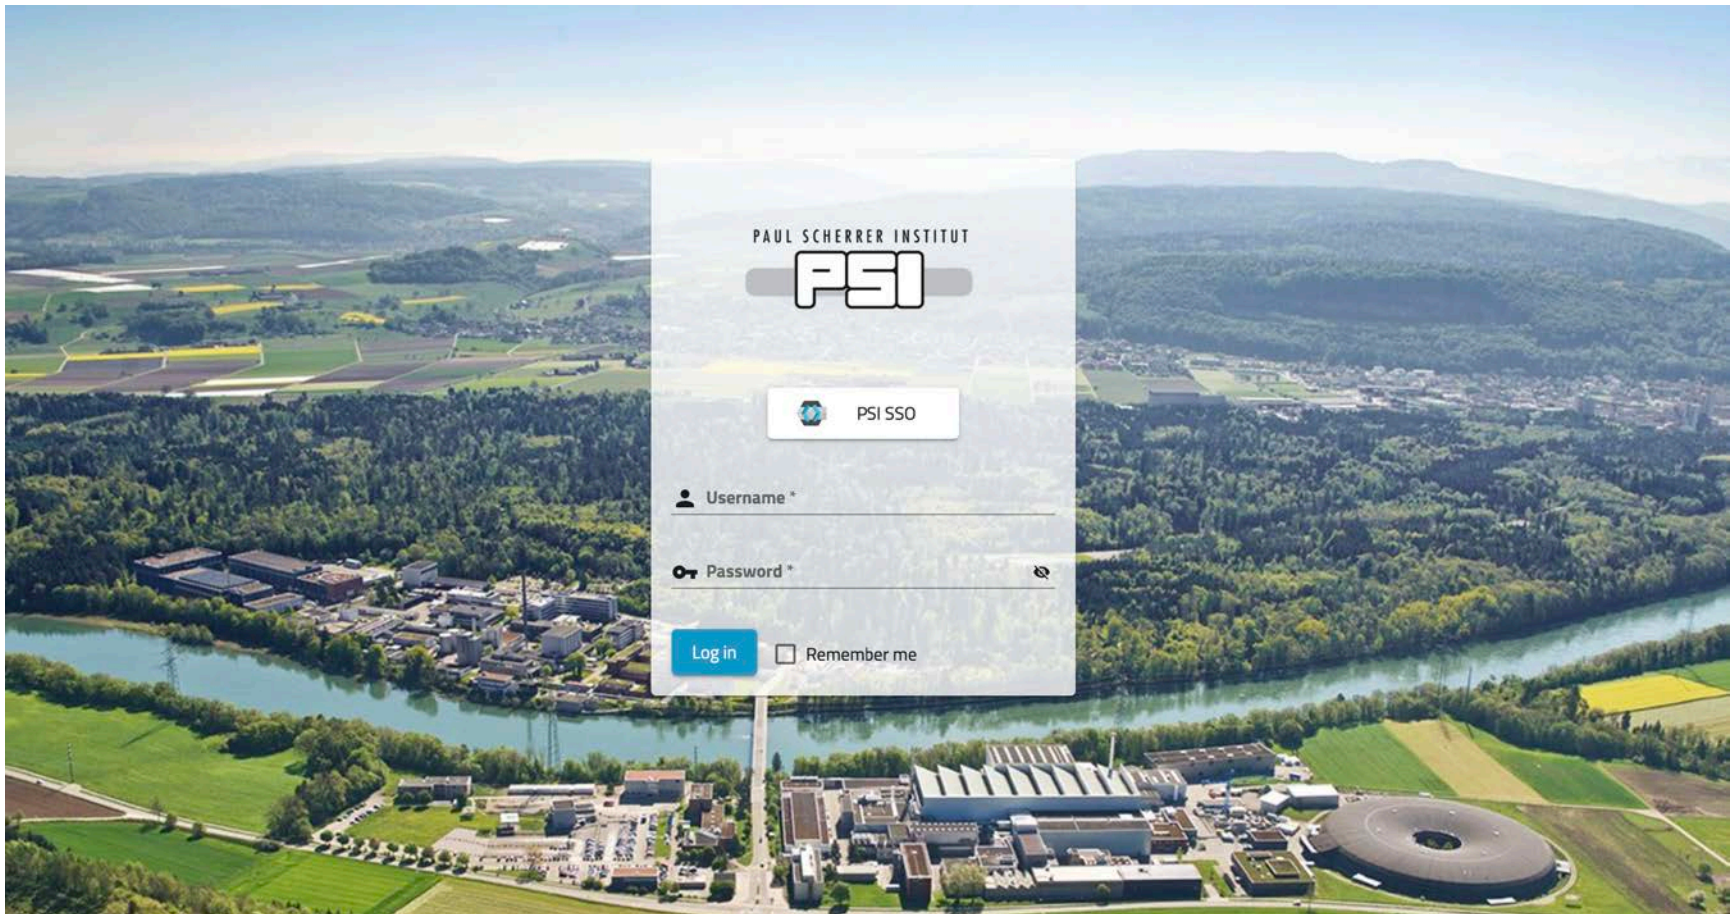

Where does SciCat help the Scientists?

- **Organize** the scientific data into datasets
- Annotate the Datasets with **administrative** and **flexible scientific metadata**
- Make the data **searchable/discoverable**
- Provides the infrastructure for **publishing** the data, DOI generation
- Can be used as frontend for **longterm** storage (Archive) solutions of mass data (PB regime)
- Supports both **open access** and **embargoed** data

User authentication

- Supported authentication methods:
 - Default accounts
 - LDAP
 - ODIC (e.g. Keycloak/Sign in with Google...)

Description *

This published data collection contains five datasets obtained by X-ray tomographic microscopy of a carbonate rock sample 5 mm in diameter and 20 mm in length. Both brine and nitrogen gas are injected into the sample at a total flow rate of 0.1 ml/min (the brine made up 85% of this total flow rate). Data were collected and processed at the TOMCAT beamline X02DA of the Swiss Light Source. The first three datasets contain the scanned volume reconstruction during unsteady-state dynamics, while last two datasets contain the same scanned volume during steady state dynamics.

Abstract *

In the related publication to these data sets, we explore the flow dynamics for two-phase flow in a porous medium (a bioclastic carbonate rock). We use state-of-the-art synchrotron X-ray tomography to capture the fluid dynamics within the pore space, with a scan time of 1 second and a temporal resolution (scan repetition rate) of 2 s. The rock sample was initially saturated with brine (DI water doped with 15%wt. KI) before brine and nitrogen gas were injected simultaneously. As the gas establishes a path through the pore space, the flow dynamics are transient. Eventually, an equilibrium is established, where the gas saturation oscillates about a constant mean value; this is referred to as steady state. There are 5 data sets, 3 of which capture the unsteady state dynamics, and 2 of which capture the steady state dynamics. The images were captured with a voxel size of $2.75 \mu\text{m}^3$. In these data sets we observe that the pore scale dynamics evolve as the macroscopic flow transitions from unsteady state to steady state. We observe that the saturation of the gas plateaus out before the differential pressure across the core. This suggests that gas phase is more mobile during unsteady state.

Real-Time Imaging Reveals Distinct Pore-Scale Dynamics During Transient and Equilibrium Subsurface Multiphase Flow

Catherine Spurin, Tom Bultreys, Maja Rücker, Gaetano Garfi, Christian M. Schlepütz, Vladimir Novak, Steffen Berg, Martin J. Blunt, Samuel Krevor; PSI (2021)

Abstract

In the related publication to these data sets, we explore the flow dynamics for two-phase flow in a porous medium (a bioclastic carbonate rock). We use state-of-the-art synchrotron X-ray tomography to capture the fluid dynamics within the pore space, with a scan time of 1 second and a temporal resolution (scan repetition rate) of 2 s. The rock sample was initially saturated with brine (DI water doped with 15%wt. KI) before brine and nitrogen gas were injected simultaneously. As the gas establishes a path through the pore space, the flow dynamics are transient. Eventually, an equilibrium is established, where the gas saturation oscillates about a constant mean value; this is referred to as steady state. There are 5 data sets, 3 of which capture the unsteady state dynamics, and 2 of which capture the steady state dynamics. The images were captured with a voxel size of $2.75 \mu\text{m}^3$. In these data sets we observe that the pore scale dynamics evolve as the macroscopic flow transitions from unsteady state to steady state. We observe that the saturation of the gas plateaus out before the differential pressure across the core. This suggests that gas phase is more mobile during unsteady state.

Data Catalog Architecture and Integration

PSI

1. Setup Mongo DB
2. Setup SciCat
3. Define ingest process
4. Setup additional SciCat packages for published data
5. Connect to IDM/proposal system

SciCat

Files for running SciCat with docker-compose.

Steps

1. Clone the repository

```
git clone https://github.com/SciCatProject/scicatlive.git
```

2. Run with the following command inside the directory

```
docker-compose up -d
```

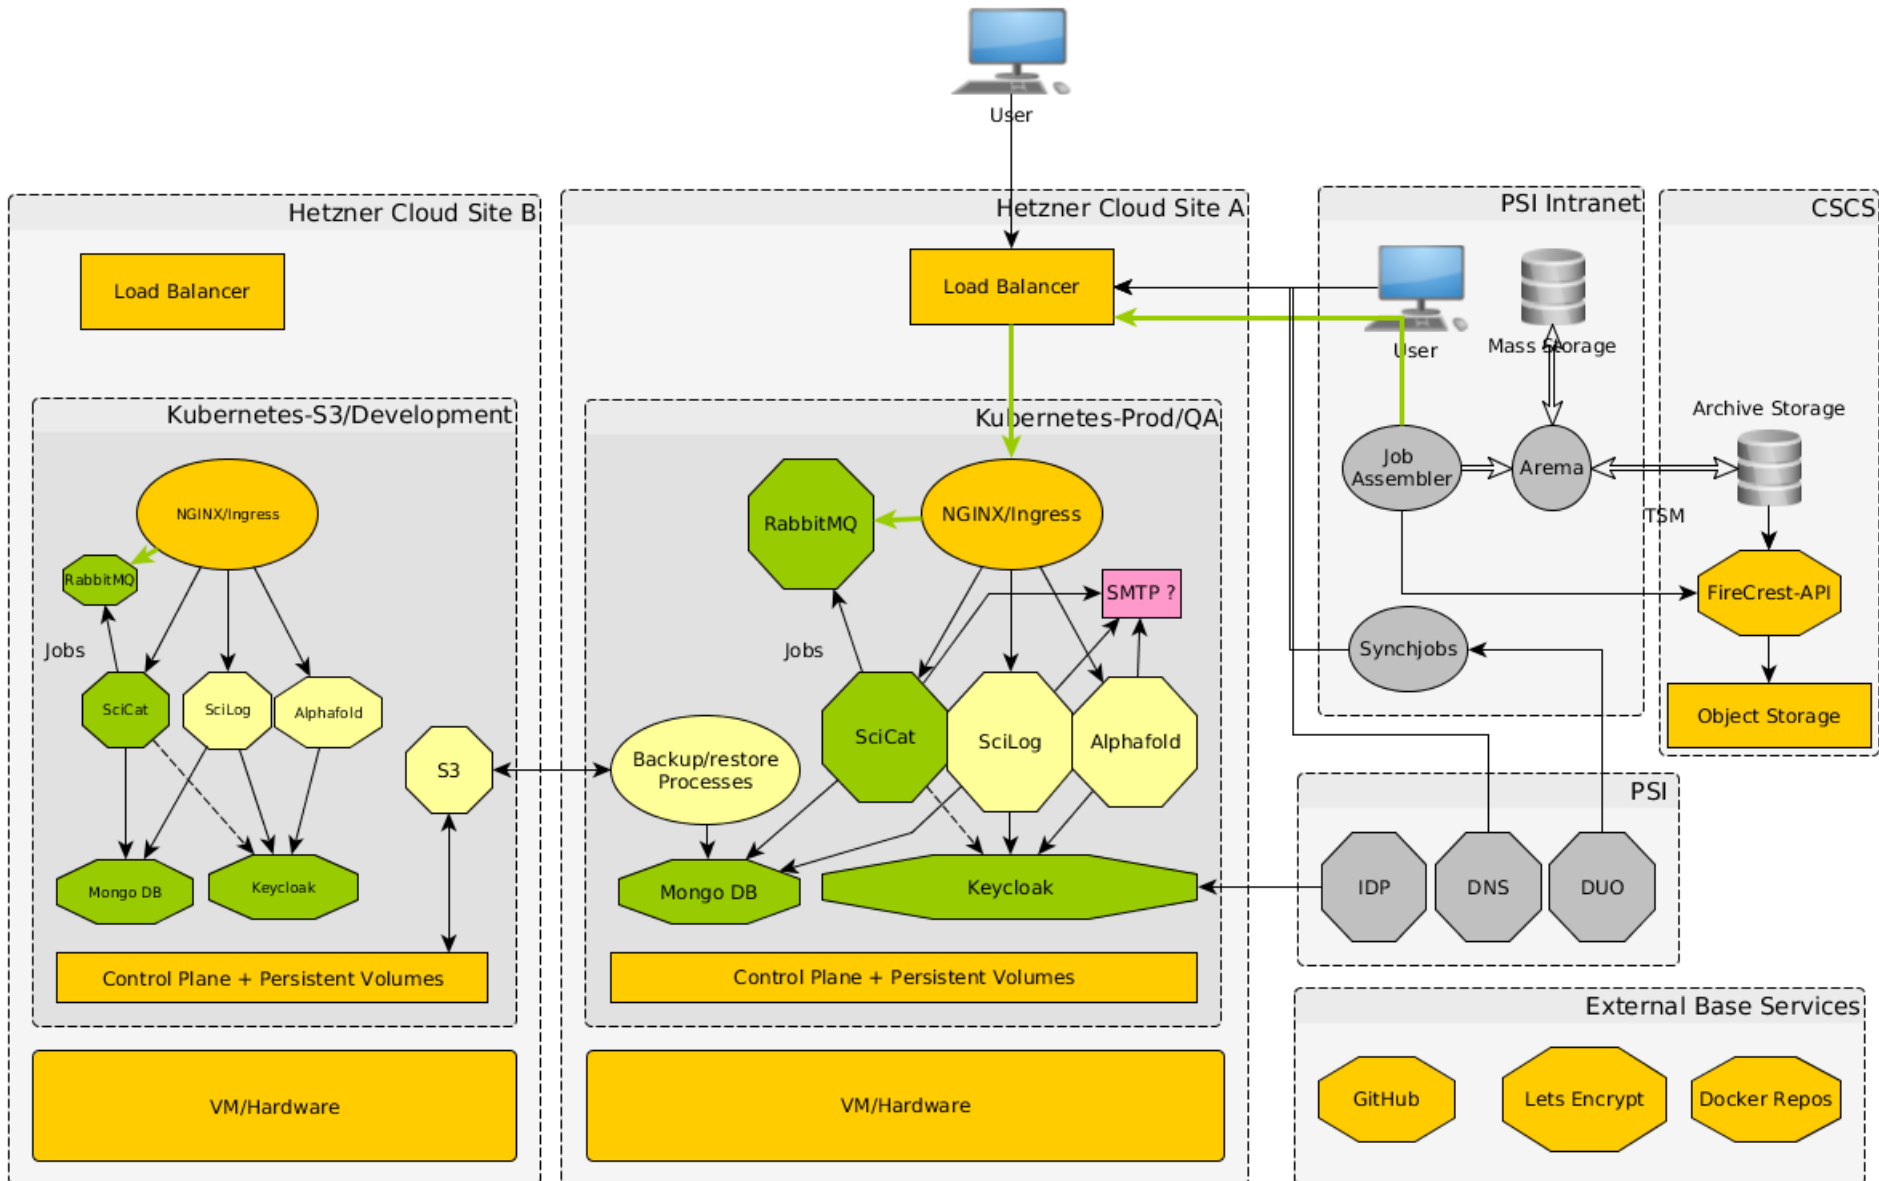

3. SciCat will now be available on <http://localhost>. The Loopback API explorer of catamel is available at <http://localhost/explorer/>, the one for the search-api at <http://localhost/panosc-explorer/>.

Add Your Local Configuration

1. Add your local configuration to [config.local.js](#)
2. Uncomment the `volumes:` line and the line containing `config.local.js` in the catamel service section in [docker-compose.yaml](#) (if commented)
3. Restart the docker containers

Metadata ingestion: 1. start e.g. from existing folder structure to define Datasets

- Datasets are the smallest unit for archiving, retrieving and publication
- Create them by defining a list of files, e.g. for raw data list all the files that logically belong to a measurement/data taking run, or any other criteria. For example: define all the files in the same directory (e.g. measurement1) as part of one dataset.

- In addition to “raw” Datasets you can create “derived” datasets containing the results of your analysis derived from the raw data. This ingest step is usually done by the user pursuing the analysis

2. Define Scientific Metadata

- The definition of scientific meta data is fully flexible.
- Ideally following a standard if it exists, e.g. NeXus based HDF5 files, extracted from instrument.
- Example:

```
"scientificMetadata": {  
  "beamlineParameters": {  
    "monostripe": "Ru/C",  
    "ring_current": {  
      "value": 0.402246,  
      "units": "A"  
    },  
    "beam_energy": {  
      "value": 22595,  
      "units": "eV"  
    }  
  },  
  "detectorParameters": {  
    "objective": 20,  
    "scintillator": "LAG 20um",  
    "exposure_time": {  
      "value": 0.4,  
      "units": "s"  
    }  
  }  
}...
```

- Migration to a new backend technology
- More granular permission model
- Increased configurability in tables in UI
- Kubernetes deployment manifests

Sites using or planning to use SciCat and contact information
