

Update muX meeting 27/01

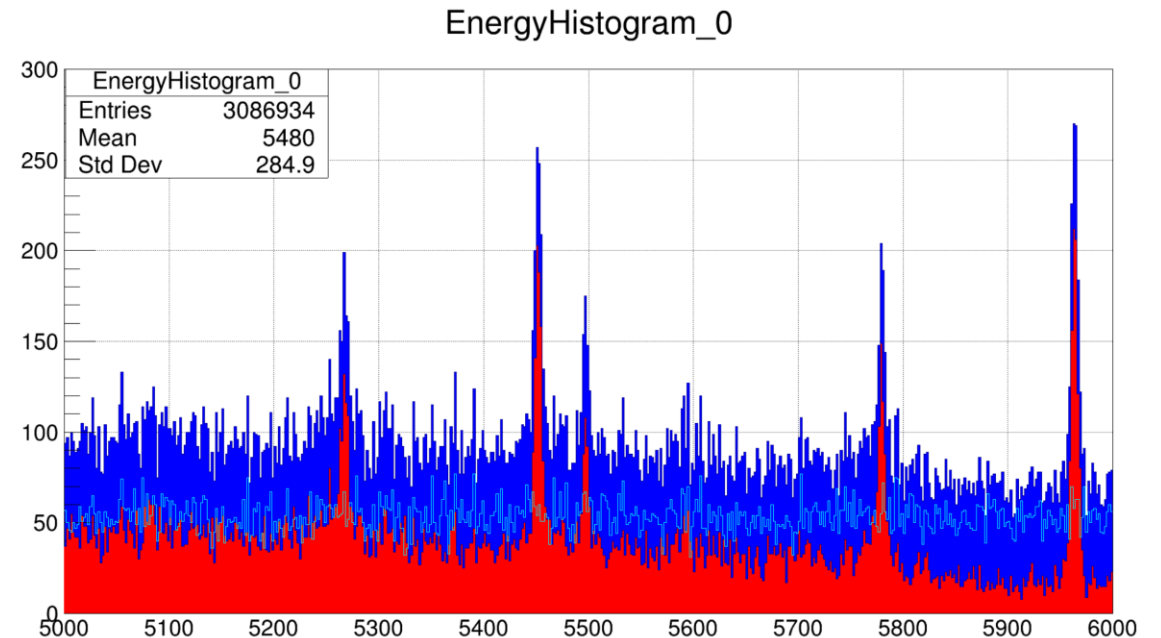

Michael Heines

Running the analyzer – Au and Ba

Flags

- From tree output → new tree with:
 - Germanium energy
 - $t_\gamma - t_\mu$
 - Germanium channel
 - PP flag [-5; +3] μs
 - Muon veto flag [-10; +10] ns
 - Electron from decay flag
 - Electron veto flag [-500; 500] ns
 - $t_e - t_{Ge}$

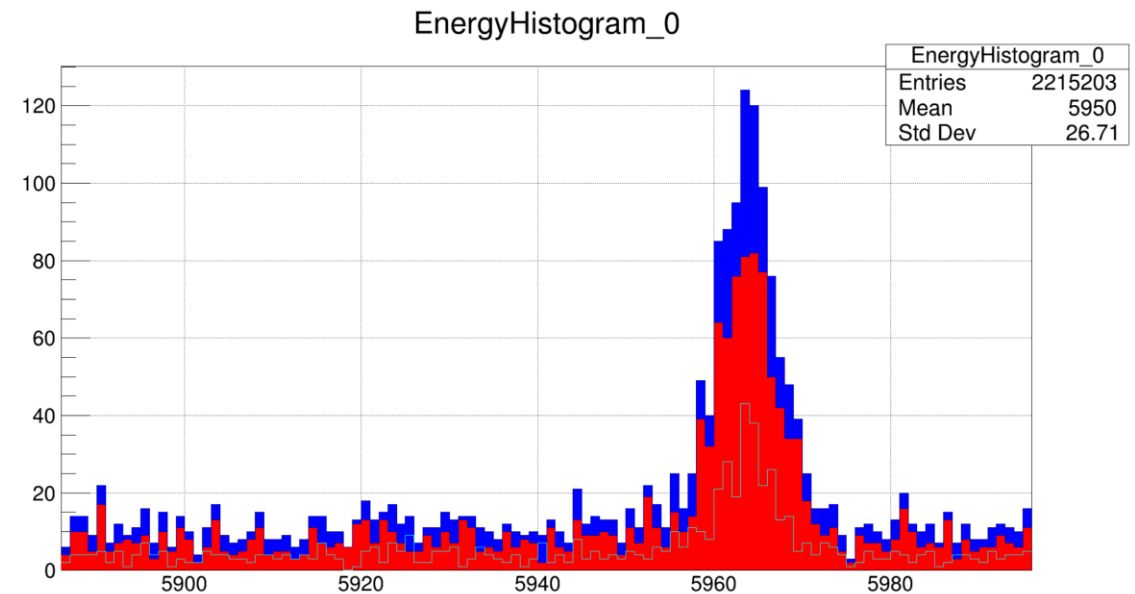

Electron veto

- Substantial improvement of background
- No real difference for windows larger than 20ns

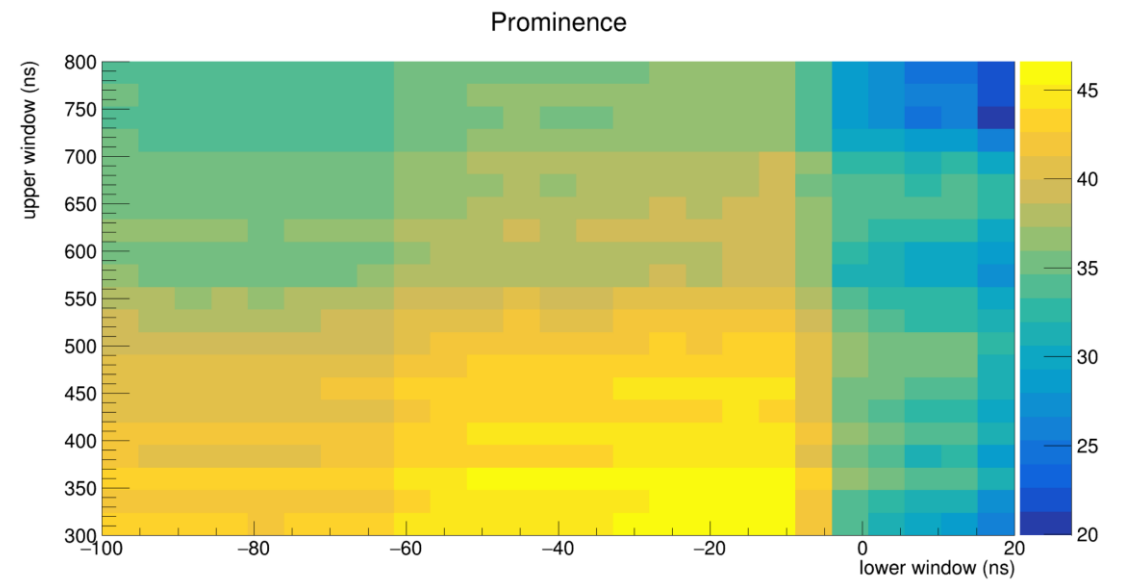

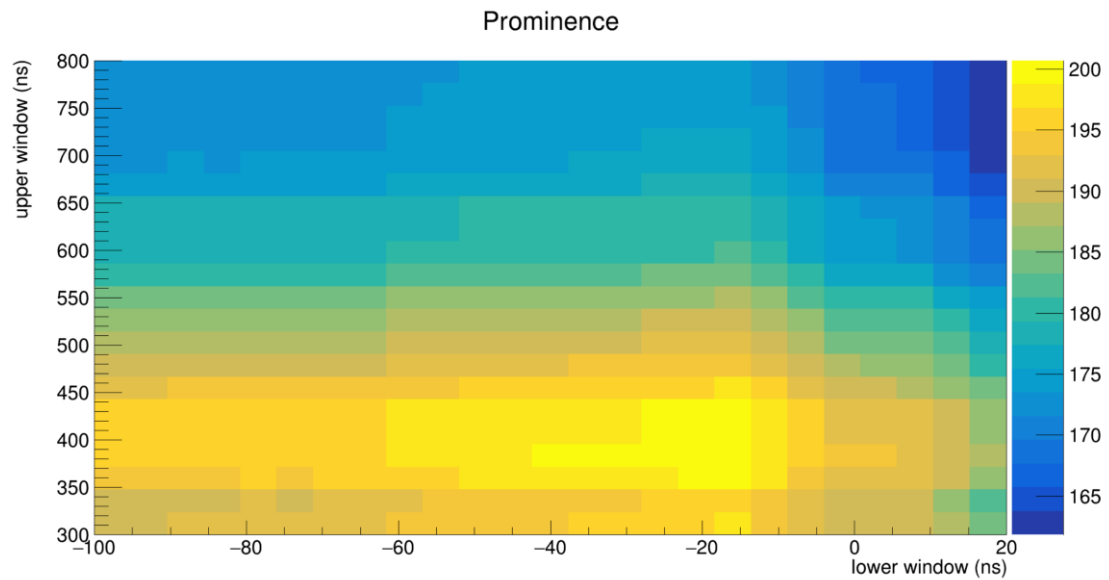

Decay electron

- Any electron between the muon and germanium hit?
- No real improvement in signal to noise and a clear reduction in signal
- At least at this energy not useful

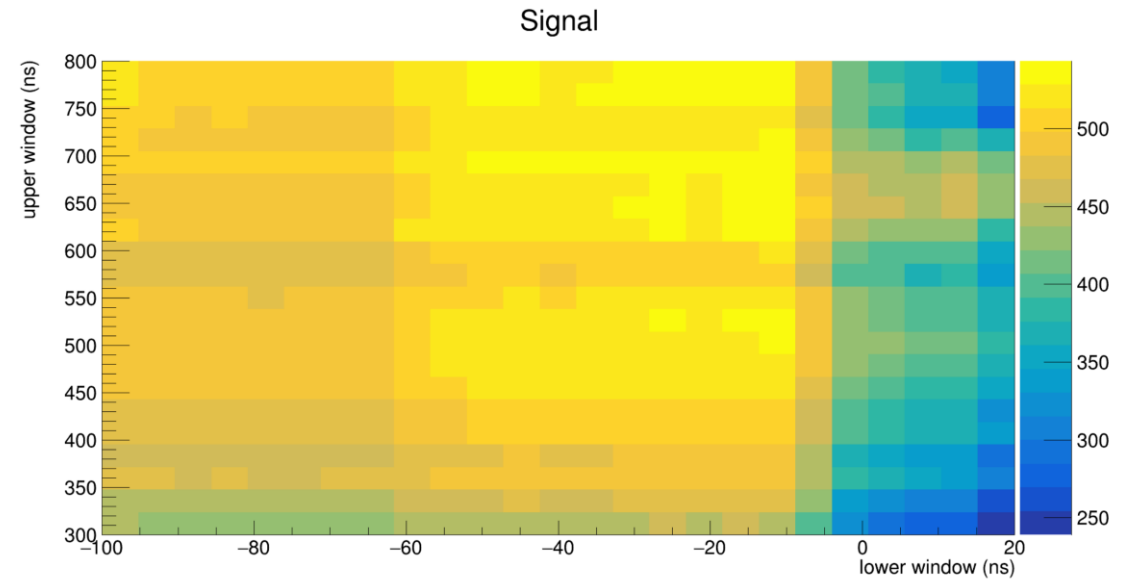

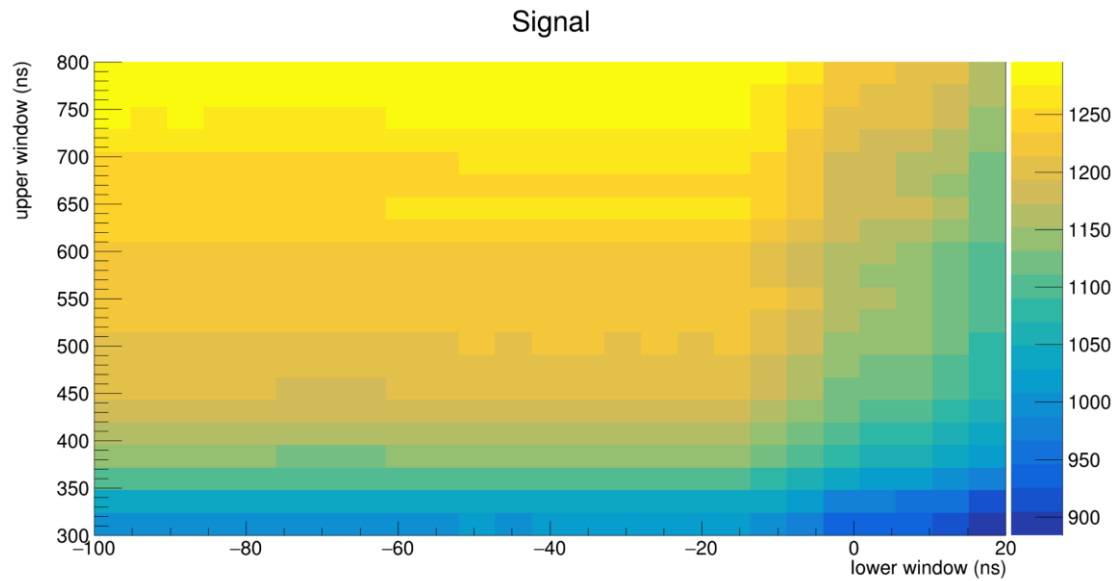

Prominence

Muon hit at about -5ns (very slight slope in ELET)

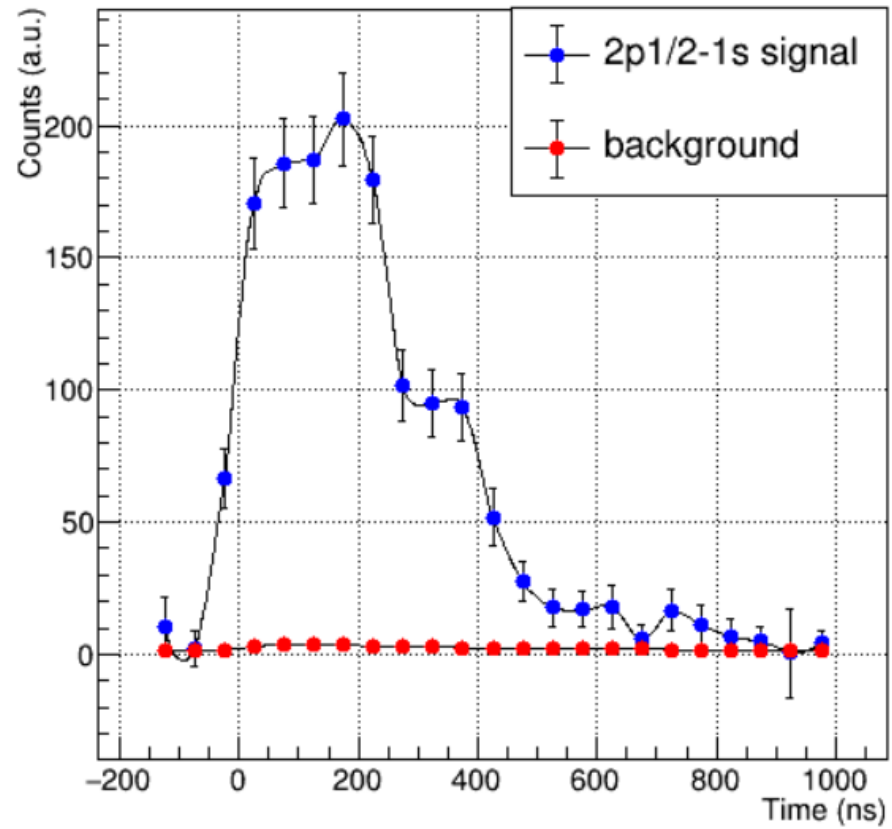

Signal

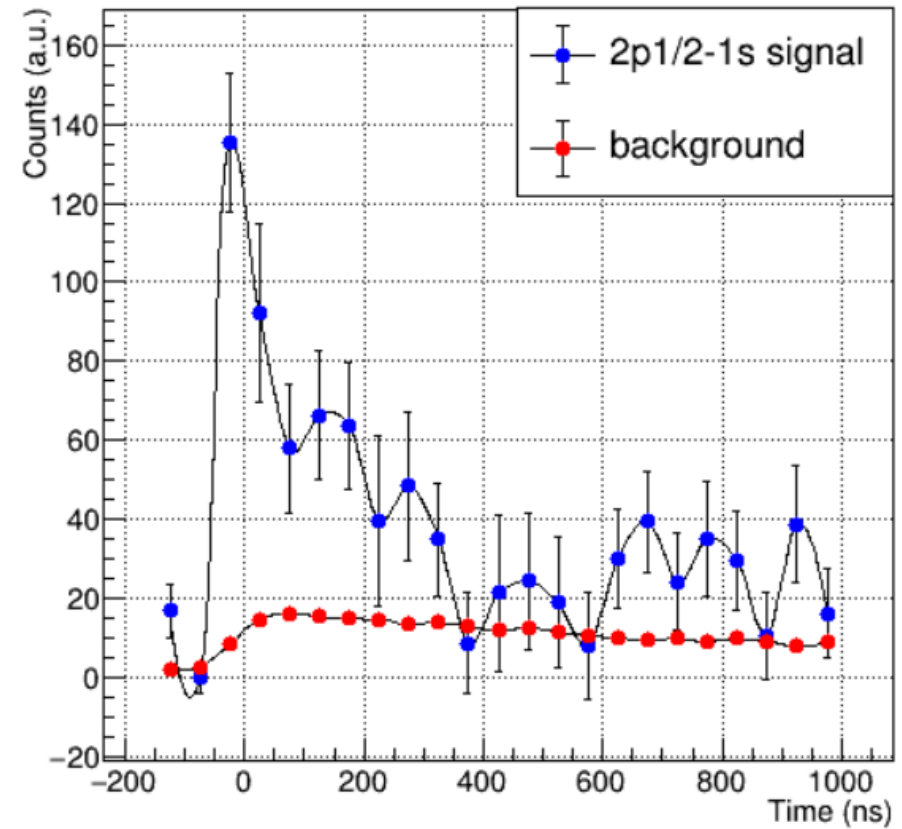

Time window

Graph

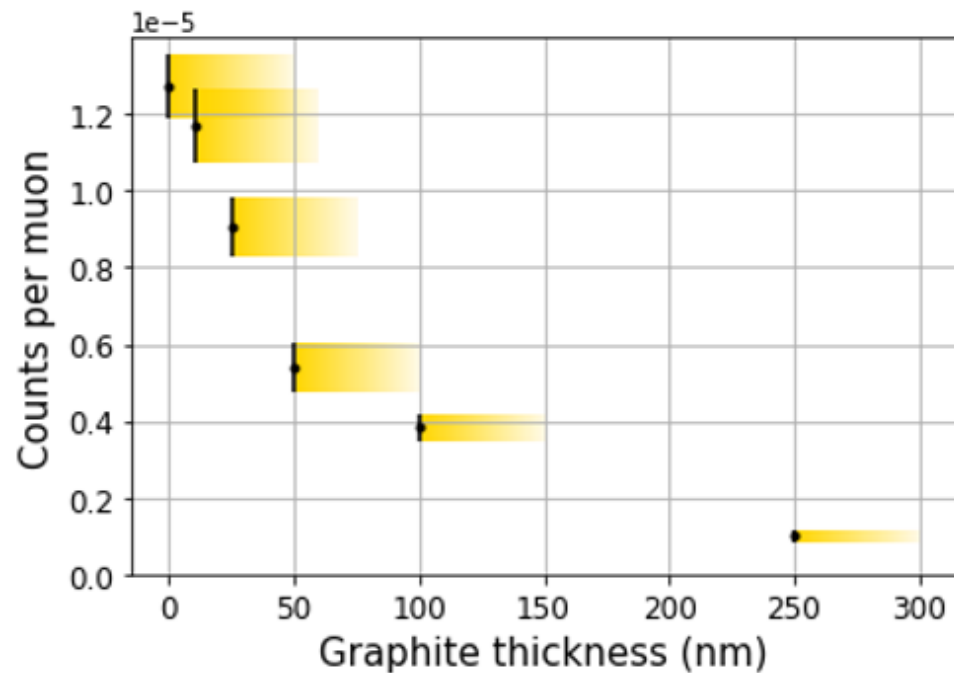

Graph

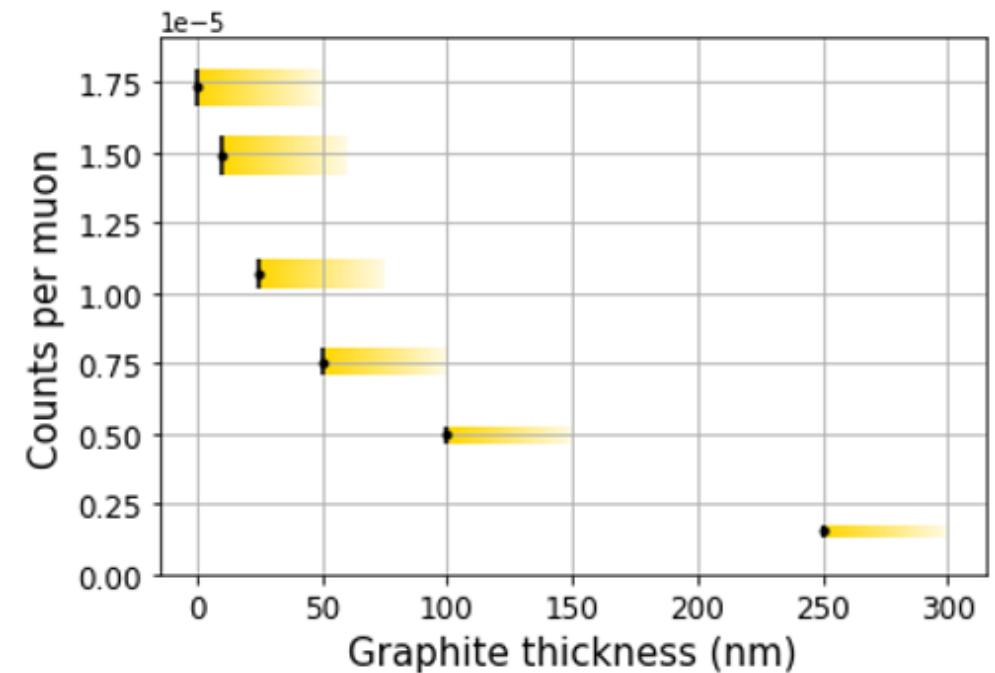

Attenuation of the signal through graphite

- Online analysis

- Offline analysis

Barium – MP

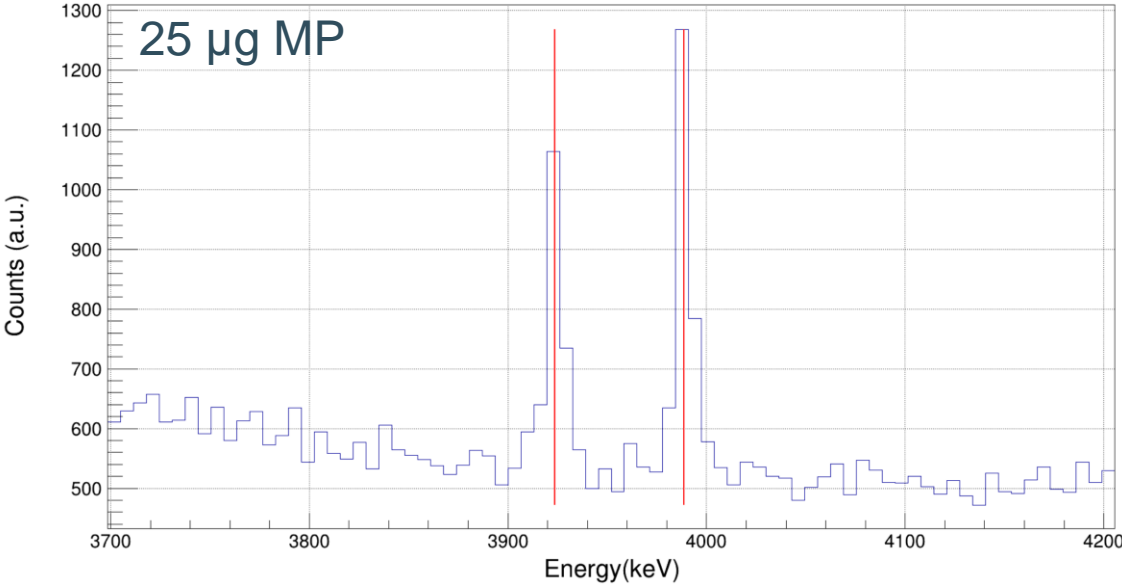

Mass (μg)	2p3/2 - 1s (e-06 /muon)	2p1/2-1s (e-06 /muon)	p3/2-p1/2 ratio
25	9.12689 +/- 0.463407	6.91748 +/- 0.560281	1.319 +/- 0.127
10	5.84666 +/- 0.32254	3.84825 +/- 0.297474	1.519 +/- 0.145
5	3.46282 +/- 0.320905	2.38675 +/- 0.262796	1.451 +/- 0.209

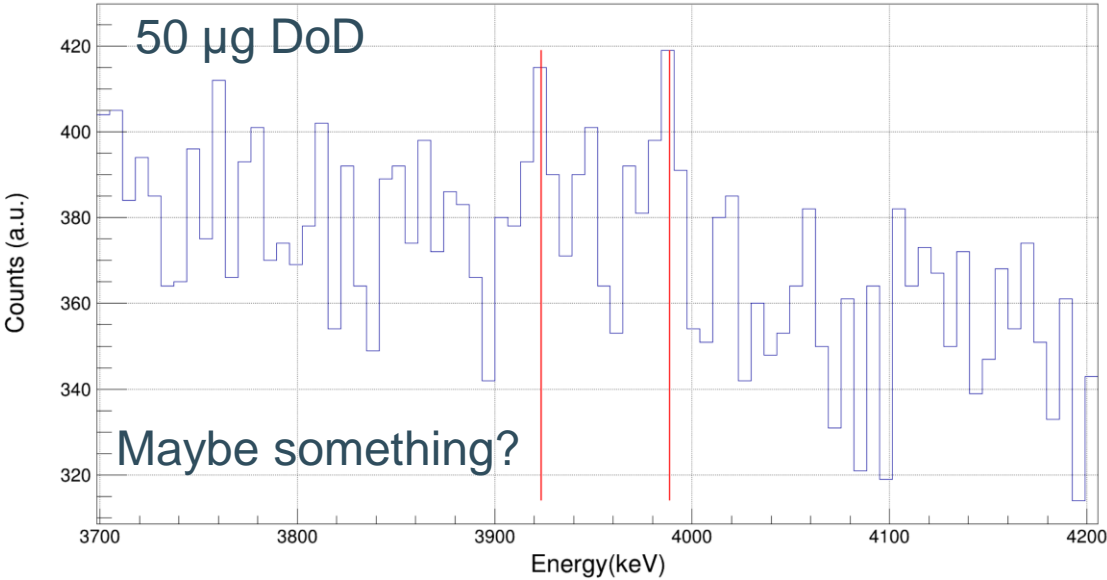

Barium – MP Vs DoD

Had to rebin to 6keV/bin

Energy Versus Time

Energy Versus Time

Barium – MP Vs DoD

Energy Versus Time

Energy Versus Time

Conclusion

- Time resolution is nice ($\sigma = 5 - 6 \text{ ns}$)
- Electron veto time window = 20ns
- Decayed electron cut doesn't help (at least at high energy)
- Ideal time window [-50; 500] ns
- Attenuation in graphite:
 - Higher signal
 - A lot smaller error than online analysis
- Barium:
 - Consistent p3/2-p1/2 ratio
 - Maybe something very minor in DoD (still much smaller)
