

Update muX meeting 16/06

Michael Heines

Fit rescaled efficiency – individual detectors

For individual fits, efficiency at 6 MeV tends to be overestimated

Fit rescaled efficiency – All detectors

All detectors that reach 6 MeV

All detectors

Estimating errors

- Standard Imfit method:

[[Variables]]

```
a0: -50.3964715 +/- 17.0457141 (33.82%) (init = -1)
a1: 32.4348745 +/- 10.0372420 (30.95%) (init = 0.01)
a2: -8.01965565 +/- 2.20147080 (27.45%) (init = 0)
a3: 0.85773288 +/- 0.21308737 (24.84%) (init = 0)
a4: -0.03411285 +/- 0.00767716 (22.51%) (init = 0)
```

Good fit for detector → Massive uncertainty

Energy (keV)	Efficiency (%)	Absolute uncertainty (%)
700	2.3	1.7e+14
1000	1.9	4.7e+15
6000	0.29	6.0e+23

- Heavy correlation → Try to solve with covariance matrix

```
[ 2.906e+02 -1.710e+02 3.746e+01 -3.619e+00 1.300e-01]
[-1.710e+02 1.007e+02 -2.209e+01 2.135e+00 -7.678e-02]
[ 3.746e+01 -2.209e+01 4.846e+00 -4.689e-01 1.687e-02]
[-3.619e+00 2.135e+00 -4.689e-01 4.541e-02 -1.635e-03]
[ 1.300e-01 -7.678e-02 1.687e-02 -1.635e-03 5.894e-05]
```

Very large negative covariances!

$$\sigma_t^2 = \begin{bmatrix} \frac{\partial t}{\partial X} & \frac{\partial t}{\partial Y} \end{bmatrix} \begin{bmatrix} \sigma_X^2 & cov(X, Y) \\ cov(X, Y) & \sigma_Y^2 \end{bmatrix} \begin{bmatrix} \frac{\partial t}{\partial X} \\ \frac{\partial t}{\partial Y} \end{bmatrix}$$

Uncertainty estimation

Detectors	1 MeV	6 MeV
All	2.0792(10)%	/
No Ge06	1.936(9)%	/
high E	1.893(10)%	0.293(10)%
high E, No Ge06	1.750(8)%	0.272(11)%

What about systematics? Hard to quantify...

Planning

- Main issues:
 - Muon stopping range in the order of 1-5 mm
 - Enriched material is expensive
- Ordering:
 - ^{39}K : 500 mg (K mass) of enriched KCl with a purity > 99.97%
 - ^{41}K : 100 mg (K mass) of enriched KCl with a purity > 98.80%
- iThemba wrapping up their developments on the separator
 - Most likely start implanting ^{40}K mid-July
 - Need minimum 8 μAh of ^{40}K (ideally more)
- Tests on 200 mg KOH (roughly same muon stopping) during MIXE?
