TABLE 16.13  
Energy levels of  $^{16}\text{O}$  a)

| $E_x$ (MeV $\pm$ keV) | $J^\pi; T$ | $K^\pi$ | $\Gamma_{c.m.}$ or $\tau_m$ (keV)                   | Decay            | Reactions   |
|-----------------------|------------|---------|---|------------------|---|
| 0                     | $0^+; 0$   |         | stable  |                  | 5, 7, 11-19, 22-24, 30, 32-34, 37-68, 70-82   |
| $6.0494\pm 1.0$       | $0^+; 0$   | $0^+$   | $\tau_m = 96\pm 7$ ps                               | $\pi$            | 5, 7, 11-13, 15, 17, 19, 21, 23, 30, 32-34, 38, 39, 43, 44, 47, 54, 55, 57, 66, 67, 70, 71, 73, 79, 81                  |
| $6.129893\pm 0.04$    | $3^-; 0$   |         | $\tau_m = 26.6\pm 0.7$ ps;<br>$g = +0.556\pm 0.004$ | $\gamma$         | 1, 5, 7, 11-13, 15, 17-19, 21, 30-34, 37-39, 43-46, 49-51, 53, 54, 66-68, 70, 71, 73, 79, 81                            |
| $6.9171\pm 0.6$       | $2^+; 0$   | $0^+$   | $\tau_m = 6.78\pm 0.19$ fs                          | $\gamma$         | 1, 5, 7, 11-13, 15, 17, 19, 30-34, 37, 38, 42-47, 49, 50, 53-55, 67, 68, 70, 71, 73, 78, 80                             |
| $7.11685\pm 0.14$     | $1^-; 0$   |         | $\tau_m = 12.0\pm 0.7$ fs                           | $\gamma$         | 1, 5, 7, 11-13, 17, 30-34, 37-39, 42-44, 46, 47, 50, 66-68, 70, 71, 73, 81  |
| $8.8719\pm 0.5$       | $2^-; 0$   |         | $\tau_m = 180\pm 16$ fs                             | $\gamma, \alpha$ | 5, 7, 11, 12, 16, 19, 30, 31, 33, 37-39, 43, 45, 47, 49, 50, 53, 55, 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81 |

39.  $^{16}\text{N}(\beta^-)^{16}\text{O}$   $Q_m = 10.419$

The ground state of  $^{16}\text{N}$  decays to seven states of  $^{16}\text{O}$ : reported branching ratios are listed in Table 16.25. The ground-state transition has the unique first-forbidden shape corresponding to  $\Delta J = 2$ , fixing  $J^\pi$  of  $^{16}\text{N}$  as  $2^-$ : see (59AJ76). The unique first-forbidden decay rates to the  $0^+$  ground state and 6.06 MeV level are well reproduced by a large-basis  $(0 + 2 + 4)\hbar\omega$  shell-model calculation (92WA25). The decays to odd-parity states (see Table 16.25) are well reproduced by recent calculations of Gamow-Teller matrix elements (93CH1A). For the  $\beta$ -decay of  $^{16}\text{N}^*(0.12)$ , see reaction 1 in  $^{16}\text{N}$ .

The  $\beta$ -delayed  $\alpha$ -decays of  $^{16}\text{O}^*(8.87, 9.59, 9.84)$  have been observed: see (71AJ02). The parity-forbidden  $\alpha$ -decay from the  $2^-$  state  $^{16}\text{O}^*(8.87)$  has been reported:  $\Gamma_\alpha = (1.03 \pm 0.28) \times 10^{-10}$  eV [ $E_\alpha = 1282 \pm 5$  keV]: see (77AJ02).

Transition energies derived from  $\gamma$ -ray measurements are:  $E_x = 6130.40 \pm 0.04$  keV [ $E_\gamma = 6129.142 \pm 0.032$  keV (82SH23)],  $E_x = 6130.379 \pm 0.04$  [ $E_\gamma = 6129.119 \pm 0.04$  keV (86KE15)] and  $E_x = 7116.85 \pm 0.14$  keV [ $E_\gamma = 7115.15 \pm 0.14$  keV]. See (77AJ02). See also p. 16 in (82OL01).

# Let's go back in time...

Somehow couldn't download the publications anymore, but if I remember correctly the value for the level and transition energy changes between these two publications with the measured gamma energy not really changing?

Typo? Wrong calculation of level from gamma energy?

# What others say

2020 JINST 15 C07005

So it looks like everything is fine with the 208Pb energies after all!

**Table 2.** The energy of photons  $E_\gamma$  emitted by  $(3^-; 0)$  excited level of  $^{16}\text{O}$ .

| N | Reaction                                | Reported energy [keV]           | Year, reference | Corrected $E_\gamma$ [keV]    |
|---|---|---------------------------------|-----------------|-------------------------------|
| 1 | $^{16}\text{N}(\beta^-)^{16}\text{O}$   | $E_\gamma = 6129.170 \pm 0.043$ | 1975, [24]      | $E_\gamma = 6129.03 \pm 0.04$ |
| 2 | $^{13}\text{C}(\alpha, n)^{16}\text{O}$ | $E_\gamma = 6129.266 \pm 0.053$ | 1981, [25]      | $E_\gamma = 6129.24 \pm 0.05$ |
| 3 | $^{19}\text{F}(n, \alpha)^{16}\text{O}$ | $E_\gamma = 6129.119 \pm 0.040$ | 1986, [26]      | $E_\gamma = 6129.12 \pm 0.04$ |
| 4 | $(3^-; 0) ^{16}\text{O}$ level          | $E_x = 6129.893 \pm 0.040$      | 1993, [27]      | $E_\gamma = 6128.63 \pm 0.04$ |

in the present reference value of the energy of  $^{198}\text{Au}$   $\gamma$ -rays. Here we would like to mention that the energy  $E_\gamma$  in the last line of table 2 is definitely in contradiction with the values in the first three lines. It is not clear from [27] how this value was obtained and why it is so different.

| $m_e$                                    | 511,003 (2)    | 510,998.902 (21) <sup>b</sup> |
| $np \rightarrow \gamma d$                | 2,223,247 (17) | 2,223,258.3 (23) <sup>c</sup> |

<sup>a</sup>The site [www.nndc.bnl.gov](http://www.nndc.bnl.gov) and [435] seem to use an erroneous value of  $E_x = 6,129,893$  (40) eV and  $E_\gamma = 6,128,630$  (40) eV. We use the average of 3 determinations [436–438], as confirmed by Wapstra [434].

<sup>b</sup>Observed annihilation radiation is slightly less than  $m_e c^2$ .

<sup>c</sup>Value of [433], as corrected by Wapstra [434].

Received 23 February 1990

### 4. The $^{16}\text{O}$ calibration gamma ray of 6129 keV

The consistency between the two scales was checked in the following comparison. Utrecht [18] determined the  $\gamma$ -ray energy of the lowest occurring  $\gamma$ -transition in  $^{16}\text{O}$  in the  $^{198}\text{Au}$  scale as 6129 266(54) eV\*, which corresponds to 6129 228 eV'. This value should be compared with a Los Alamos value 6129 121(22) eV' derived from a difference [19] of 121 174(21) eV\* with the neutron-capture  $\gamma$ -ray to  $^3\text{T}$  and a McMaster [20] value 6129 095(40) eV' measured through comparison with  $^{14}\text{N}(n, \gamma)$   $\gamma$ -rays (slightly corrected in view of the discussion of  $^{15}\text{N}$  below). The Utrecht “diffraction” value is 18(10) ppm higher than the averaged “mass-spectrometry” result.

Proposed accepted value: 6 129 140(30) eV'.
