The SwissFEL X-Ray Laser Project

Thursday, 15 September 2011 16:45 (15 minutes)

The Paul Scherrer Institute is planning the construction of a X-ray free electron laser (SwissFEL), which will produce 20 fsec pulses of coherent x-rays in the wavelength range 0.1 to 7 nm, with extremely high peak brightness. These characteristics will provide opportunities for new experiments in chemistry, solid state physics, biochemistry and materials science. The presentation will focus on novel applications, the description of the fundamental aspects of the planned facility, and last but not least the milestones towards the planned operation.
