## Langevin dynamics and probing the atomic scale

Friday, 16 September 2011 16:30 (20 minutes)

Thermal fluctuations at the atomic scale play a fundamental role in the dynamics of microscopic processes such as magnetism, transport and micro-structural evolution. Langevin dynamics can sometimes provide a description of such phenomenon and its mathematical realization constitutes one example of a stochastic differential equation. In this talk, the Langevin approach is introduced and discussed in the context of the short time and length scales accessible to current and future generation light sources.
