

# A multi-pass optical cavity for the HyperMu experiment

Mirostaw Marszałek

*On behalf of the CREMA collaboration*

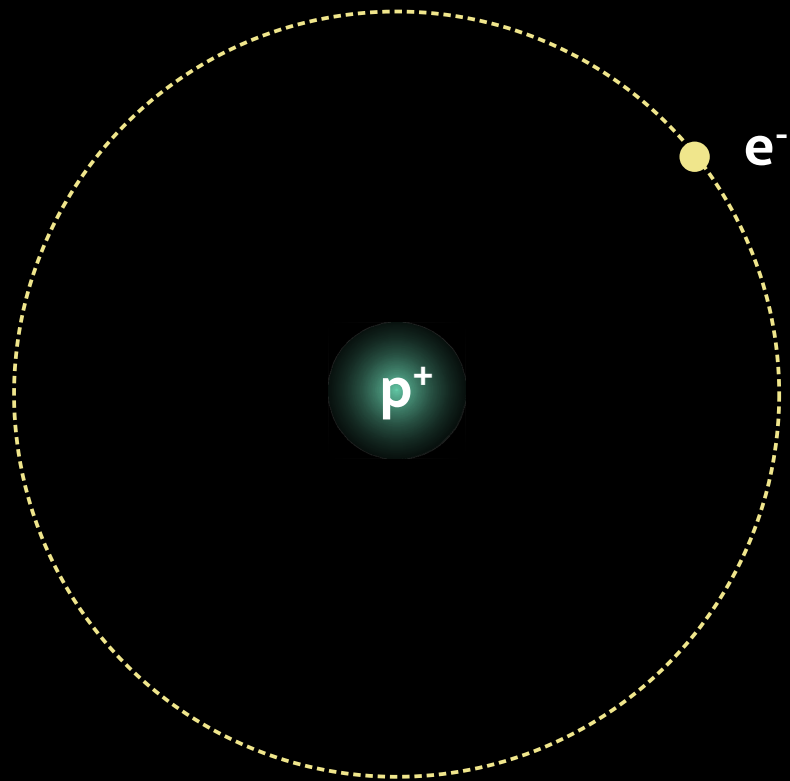

# Electronic hydrogen

# Muonic hydrogen

## Electronic hydrogen

## Muonic hydrogen

$$\Delta E \propto |\Psi(\mathbf{0})|^2 \propto m_r^3$$

$$m_\mu \approx 200 m_e$$

$$\Delta E_\mu \sim 10^7 \Delta E_e$$

**HFS  $\rightarrow$  Zemach radius**

In progress!

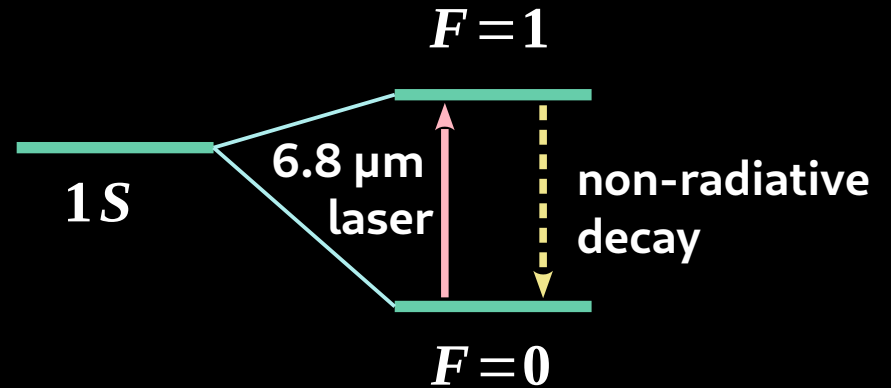

## Lamb shift

## Hyperfine splitting

- Magnetic dipole transition
- No emitted photon

muon  
beam

H<sub>2</sub> gas  
at 50K

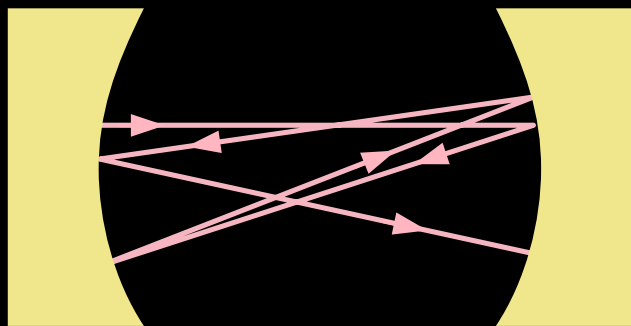

- Operation at 50 K
- Large illuminated volume
- Large laser fluence required ( $2 \text{ J/cm}^2$ )
- ~500 reflections through a 1 mm gap

Stable

vs.

Unstable

$L < 2R$

$L \geq 2R$

# Resonant

$$R = \frac{L}{2} \left[ 1 + \left( \frac{\pi w_0^2}{L/2} \right)^2 \right]$$

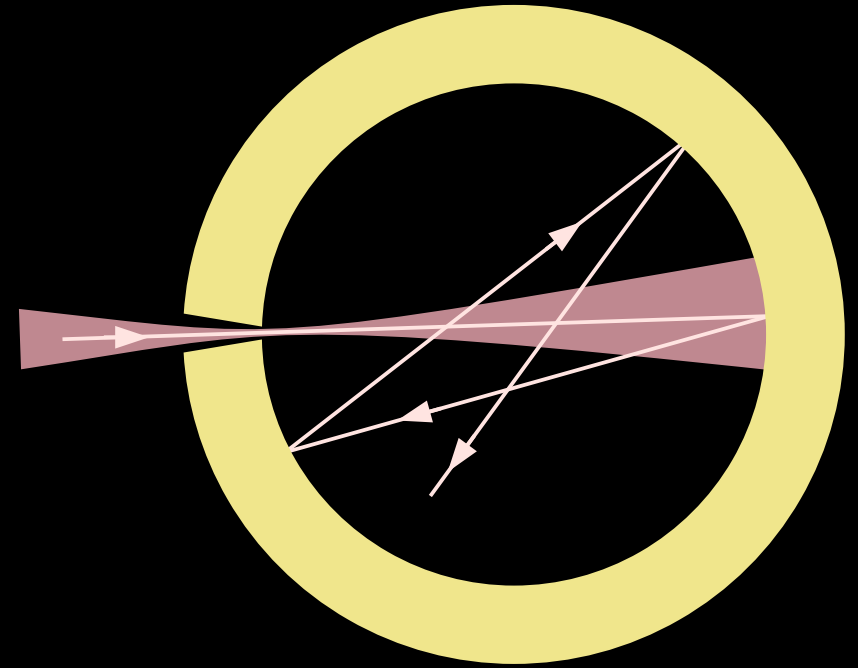

# Design No. 1.

# Design No. 1.

$$L < 2R_y$$

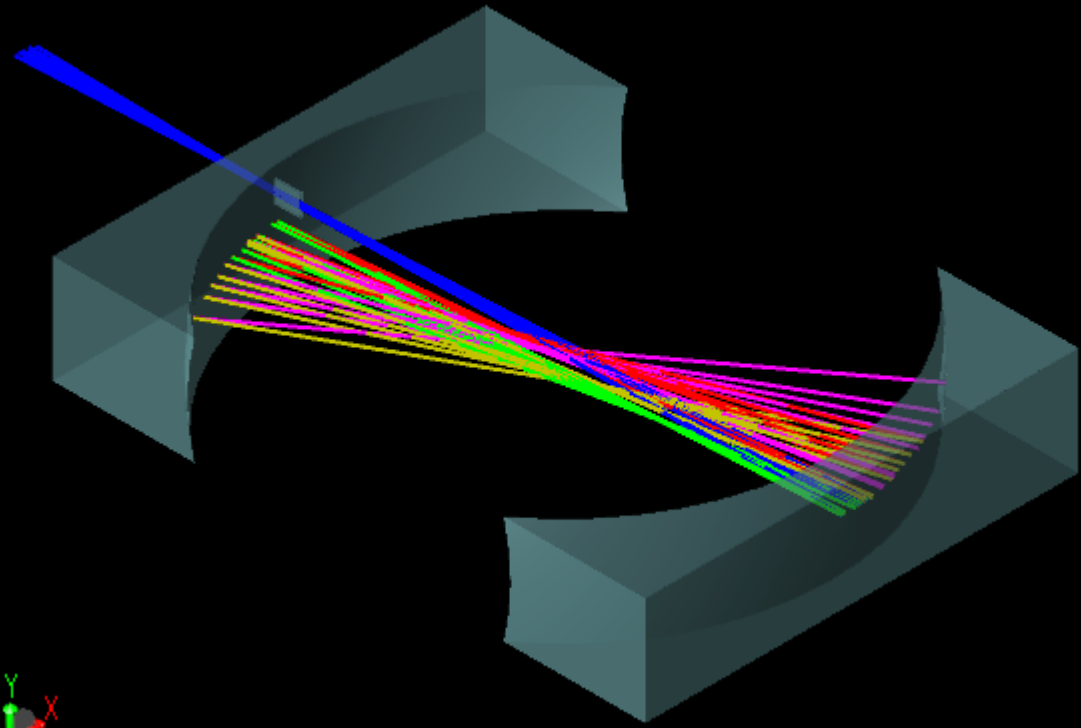

$$L = 2R_x$$

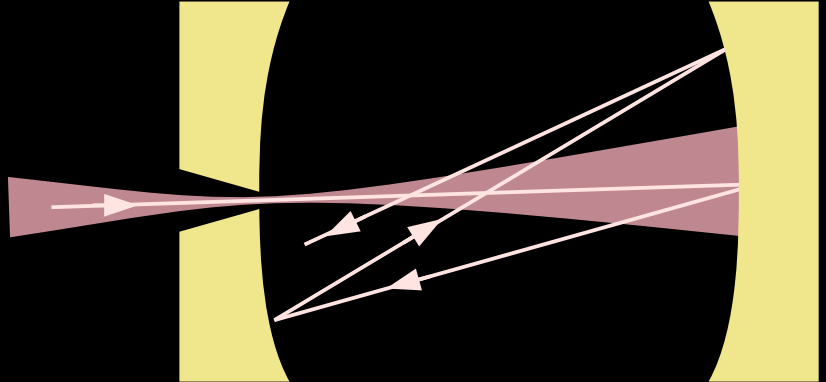

# Design No. 2.

# Design No. 2.

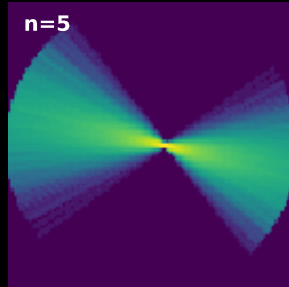

$$L < 2R_y$$

$$L < 2R_x$$

mirror reflectivity

$10^{-4} - 10^{-2}$

$$\propto \exp(-t/\tau)$$

$$\tau = - \frac{L}{c \ln R}$$

# Summary

- 2 possible designs of the cavity
- First prototypes have arrived
- Preparing for tests
