

## Proton Crate

```
In [3]: from IPython.display import Markdown as md
import matplotlib.pyplot as plt
import seaborn as sns
graphColors = ["#e6194b", "#3cb44b", "#ffe119", "#0082c8", "#f58231", "#911eb4", "#46f0f0", "#f032e6", "#d2f53c", "#fabed9", "#008080", "#e6beff", "#aa6e28", "#fffac8", "#800000", "#aaffc3", "#808000", "#ffd8b1", "#000080", "#808080", "#000000"]
sns.set_palette(sns.color_palette(graphColors))
plt.style.use('seaborn-paper')
import scipy.constants as sc # see https://docs.scipy.org/doc/scipy/reference/constants.html
import math
import numpy as np
from scipy.optimize import fsolve
%matplotlib notebook
```

## Powerboard dimensions?

```
In [4]: # prototype dimensions
min_height = 22 #mm
height = 25 #mm
controller_height = 15 #mm
width = 45 #mm
```

## Height

Moritz' his coil design:

- ID = 16.2 mm
- OD = 26 mm
- Height = 10.5 mm

The wire is 2 mm. In addition, the wire has to bend. Looking at the current prototype in the lab, the **height of the full aircoil is < 16 mm**. Some extra space is needed for:

- Connection on the board, being mounted on top SMD components. **extra 1 mm**
- Cooling shielded if need. **extra 2 mm ?**

Board thickness: **1.57 mm**

Through component and components on the bottom side: **1 mm**

**Total** : 21.57 mm

- Minimum Height: **{{min\_height}} mm**
- Comfortable Height: **{{height}} mm**

## Width

First prototype has a **{{width}}** mm width. So a **width of maximum {{width+5}} mm** is feasible.

## Length

Current prototype has a length of 70 mm. It would be better put the secondary filter nice in line with the main LC filter. We **aim for 80 to 100 mm?**

This is a bit bigger than the space currently foreseen:

## Detector cage constrains

This is not clear from the grabcad drawings.

- 20 x 10 cm should definitely be now problem, but that is a to little space
- 30 x 15 cm seems feasible?

But Stefan Hetzel's drawing does not show the same cage? Or just and extra support spoke?

## Power board arrangement

### Number of boards

112 (2 VDC / power partitions) + 14 (3.3 VDC MALIBU) = 126 → 32 power boards per side + 2 controllers

==> 2 x ( 1 controler + 16 power boards)

### Arrangement

Space for controller:  $\{\{controler\_height\}\}$  mm (?)

To the below estimates, some space needs to be added for mounting mechanics and connectors

#### Controler + 16 boards crate

The elegant option of 1 crate with 16 boards probably does not fit

Total width crate =  $\{\{16*height + controler\_height\}\}$  mm (tight fit =  $\{\{16*min\_height + controler\_height\}\}$  mm)

total height 2 crates =  $\{\{2 * ( width + 5 )\}\}$  mm

#### 3 x 11 slots

This probably fits, not to elegant though regarding the back plane

Total width crate =  $\{\{11*height + controler\_height\}\}$  mm (tight fit =  $\{\{11*min\_height + controler\_height\}\}$  mm)

total height =  $\{\{3 * ( width + 5 )\}\}$  mm

#### 2 x 2 x 8 slots

This is a *double* crate arrangement. Quite high (ignoring the controler board):

Height =  $\{\{8*height\}\}$  mm (tight fit =  $\{\{8*min\_height\}\}$  mm)

Has space for the controler board and input connectors in the corners

**Width =  $\{\{4 * ( width + 5 )\}\}$  mm**

( + some extra space for mechanics )

## Mechanical design

### "Box" design

In the first CAD implementation, every powerboard is a separat box containing the PCB

Held, and separated my these rails:

([https://www.fischerelektronik.de/web\\_fischer/de\\_DE/K%C3%BChlk%C3%B6rper/E02.02/F%C3%BChrungsschienen/Pg/MSVL/search.xhtml](https://www.fischerelektronik.de/web_fischer/de_DE/K%C3%BChlk%C3%B6rper/E02.02/F%C3%BChrungsschienen/Pg/MSVL/search.xhtml))

This actually allows for a fairly close packing, with only 3 mm space between 2 rows/columns. The 2 mm gap is more then the PCB thickness (standard?). We can either

- Shove the PCB in the rails and add a narrower shielding box
- Make a narrower PCB, and mount it in a box. This has some cooling and shielding advantages

### "Crate" design

Vendors of flexible/mini crates:

- [Subrack](http://www.pixustechnologies.com/products/category/subracks) (<http://www.pixustechnologies.com/products/category/subracks>) with individual [components](http://www.pixustechnologies.com/assets/Uploads/Subrack-components-individual.pdf) (<http://www.pixustechnologies.com/assets/Uploads/Subrack-components-individual.pdf>)
- [EuropacPRO](https://www.digikey.de/product-detail/de/schroff/24563172/1439-1210-ND/4209939) (<https://www.digikey.de/product-detail/de/schroff/24563172/1439-1210-ND/4209939>) kit
- [various digikey options](https://www.digikey.de/products/en/boxes-enclosures-racks/card-racks/588) (<https://www.digikey.de/products/en/boxes-enclosures-racks/card-racks/588>) and [here](https://www.digikey.de/catalog/en/search?filters=51728) (<https://www.digikey.de/catalog/en/search?filters=51728>)

Standard dimensions:

- HP pitch: the standard horizontal pitch on crates. 0.2 inch, or 5.08 mm. 5 HP's for Power boards would then be 25.4 mm.
- 1U is 1.75 inch or 4.45 cm. However, there are no crate kits with 1U in height

The problems with these kits, is that you add e.g. 16 mm to the width of a card from the [guide rails](https://www.vectorelect.com/card-guides-cg1-series.html) (<https://www.vectorelect.com/card-guides-cg1-series.html>) and the [mechanics](https://www.vectorelect.com/1404-0017-84.html) (<https://www.vectorelect.com/1404-0017-84.html>). Unless we find a more compact option, this wont work.

## **"Homebrew/custom" crate**

aka make all components custom

## **"Bigger" cards**

We have could combine 2 or 3 converters, electricly isolated. Not my favorite option, but we can make 3U cards then.
